Logically the high-pressure service is the solution of the water and pumping question in fire protection, as greater pressures can be delivered from the hydrants than from portable fire engines, and also a greater supply of water can be concentrated on any single district than any reasonable number of fire engines could pump. Accordingly, with the growth of such a system, the portable fire engine must be eliminated in the more closely settled cities, and such fire engines as are employed be designed to deal immediately with an incipient outbreak. Furthermore, the high-pressure system is particularly available where there are tall buildings, as its pressure enables a fire to be fought by the use of permanent standpipes of neighboring structures or of the building itself.

The nature and function of the fire engine in its different forms of development are considered elsewhere, but mention should be made of the equipment of the modern fire engine which motorization has made possible. A fire chief at Newton, Mass., in 1903 was the first to use a motor, and the same year the first motor-drawn chemical engine was installed at New London, Conn. Motor-propelled apparatus has now demonstrated its economy, usefulness, and reliability, and is being installed in place of horse-drawn machines practically everywhere. The provision of such apparatus for the model fire department at the Panama-Pacific International Exposition of 1915 may be considered as settling any previous doubts on this subject. A small motor-pumping fire engine carries usually two 40-gallon chemical tanks with 200 feet of chemical hose as well as a supply of fire hose for use with the pumps. It should carry also axes, hooks, pikes, and scaling ladders, so that, sent out to answer an alarm immediately, it should deal effectively with any small outbreak, as one or two trained men can often command the situation at once.

Whatever the source of water, whether it be a high-pressure system, a steam fire engine, or a motor-pumping engine, hose of strength and durability is required in adequate amounts. For the transporting of this hose a hose tender, formerly drawn by horses, but now practically universally with all new equipment self-propelled, is required. This vehicle may carry the heavy 3-inch hose of great strength required for a high-pressure service arranged in 50-foot lengths with heavy bronze coupling between the lengths, or the smaller hose for fire engines which is much easier for the firemen to handle if it will deliver sufficient water. The hose is made of the finest grades of Sea Island cotton, coated with rubber within and without, and must pass a rigorous inspection. The pressure to which it is subjected must be in excess of any ordinary use, and usually representatives of the insurance interests are present at such tests, while the material and method of construction may be subject to the approval of a technical laboratory and duly labeled or stamped with the approval of the inspecting bureau. Considerable progress has been made recently in the attempt to secure standard and uniform hose couplings, so that not only can all the hose of a single fire department be available for all conditions of service, but where a department is reinforced by apparatus from a neighboring city the hose connections can be used directly either with hydrants or other hose. A serious difficulty in the use of hose is the fact that the pressure diminishes very rapidly through interior friction, and accordingly when the lines are laid care should be taken to have them as direct as possible. The water is delivered from the hose through a nozzle or play pipe, which is of metal, tapering from the size of the hose to that demanded by the desired size of stream which ranges from 1 inch to 2½ or 3 inches, the latter being the size of orifice of a large play pipe when several lines of hose are Siamesed together to secure a maximum volume of water. The nozzle may have a control valve enabling the firemen to shut off the stream, while there may be also relief valves on either the hydrant or at the fire engine, so that the pressure may be suitably relieved without the danger of bursting the hose or making the nozzle difficult to handle.

In connection with high-pressure practice a

suitable regulating valve is required at the hydrant in order that an individual stream may be controlled irrespective of the general action of the pumps or what may be demanded at other points. Various forms of nozzles are used, such as for cellar fires, where through a hole chopped in the floor a stream may be directed in any desired direction and a large volume of water delivered. With high-pressure lines a tripod or other stand is often used, as otherwise it is difficult for several men to control the nozzle through which a heavy stream is being delivered. Monitor or turret nozzles are often arranged on hose tenders and fire boats, as well as on the base of a water tower, thus insuring stability and enabling the stream to be directed properly.

The water tower is a valuable portion of the equipment of a fire department, especially with tall buildings, and was developed to deal with fires in high buildings before the skyscraper epoch. The water tower is a truck carrying an elevated nozzle which may be swung from a horizontal position to the vertical and then extended to a height of about 65 feet, enabling a stream to be delivered against or into a building from without. Several lines of hose can be connected at the base of the water tower, while the standpipe can be changed in direction at will or raised or lowered. The water tower has the further advantage over hose of the smoother interior surface cutting down the friction. Of course, in buildings of 20 or 30 stories in height the water tower is not available, and such fires must be fought from within the structure with the local protection afforded by the pumps and fire lines of the building. The modern water tower is now motor-driven by some form of powerful tractor, several of those in the New York City fire department being fitted with a gas-electric tractor with power at each of the four wheels, which is substituted for the front wheels and horse-draft gear of the older machines.

The hook-and-ladder truck has also been materially improved within recent years. Like the water tower, the aerial ladder, which could be extended to a height of 85 feet, furnished a serious problem for a team of three horses to draw in winter with snow or ice on the pavement. The horses now have been supplanted by some form of motor mechanism, either as a tractor or applied directly to each of the wheels of the ladder truck. In New York City front-drive tractors have been used for hook-and-ladder trucks, as well as couple-gear gas electric machines where the power is delivered to a motor at each of the four wheels. In other cities storage batteries have been used with success, while various other forms of tractors have been employed, and also automobile engines with a long shaft working directly on the rear wheels. The aerial ladder truck is usually mounted on a turntable and trunnions over the front wheels and can be extended either by hand or power, the various applications differing in different types. In one form an electric motor is used to elevate the ladder and send up the fly ladder to its full height. In another a system of springs performs this function, while in still another type gas is generated for this purpose. The hook-and-ladder truck carries, in addition to the main extension ladder, other ladders which can be leaned against the side of the building, pom-pier or scaling ladders, hooks, pikes, door openers, roof cutters, axes, life-saving nets, and other tools used by the firemen. It is steered by a

tillerman as well as by the driver controlling the motor.

The hose wagon, or tender, varies in design with the amount of hose to be carried. It is usually an efficient form of automobile truck capable of a speed of 40 miles an hour and holding as much hose as may be needed. It carries the necessary nozzles and other tools, usually mounts a turret nozzle behind the driver's seat, and two or more chemical extinguishers. The firemen are transported on the hose tender.

Searchlight companies have been organized in the New York fire department, where a portable engine and dynamo supply current for a powerful projection apparatus which can illuminate any desired portion of the scene of operation.

The modern fire house is being gradually improved and with the advent of motor apparatus partakes less of the character of a stable. It is considered good economy to install a double company in a single house, and often a fire-engine company and hook-and-ladder truck occupy the same building, which is usually two or three stories in height. The men sleep on the upper floors, and brass sliding poles pass through the house, enabling the men to reach the main floor and apparatus in the quickest possible time when the alarm strikes. With a horse company the alarm not only sounds, but releases the chains in front of the horses' stalls, opens the doors, and, if it is night, turns on all the lights in the house automatically, this latter performance being customary, naturally, in motor companies also. The harnesses are suspended above the horses, and a few buckles only must be snapped to enable them to proceed on their way.

The fireman makes use of numerous minor devices in his work. A scaling or pom-pier ladder, consisting of a wooden pole with a metal toothed hook at the top and crosspieces for climbing, is very useful in enabling him to climb from one window to another of a building. Life nets, which are circular affairs of rope, are used as a final resort for those who must jump from a burning building and serve a useful purpose where the distance is not too great. Life guns, by which a cord may be shot in the air, are also useful in carrying up a life line by which a rope can be hauled up and made fast by a person otherwise cut off. Respirators and smoke protectors are used extensively in Europe, but have not found as wide application in the United States, where firemen are now waiting for a satisfactory device to be developed. They consist of a filter of wet sponge, cotton, or other material, or some device enabling oxygen to be breathed, fastened over the mouth and nose to prevent suffocation. Numerous devices more or less patterned on a diver's helmet are also in use.

The modern fire department must be self-contained, with adequate facilities for repairing its apparatus and taking care of any emergency. In many cities the policy of standardization is followed, whereby the apparatus and its parts are interchangeable, and devices may be replaced at once from a common store.

Supplementing municipal-government fire services, private fire departments have been found necessary in many large industrial establishments. These consist usually in the organization of the employees so that each will take an appointed station with or without apparatus on an alarm of fire, and the provision of simple and suitable appliances sufficient to deal with any local or

incipient outbreak of fire. To further such organization there are generally provided special fire pumps in the engine room, an independent system of fire mains fed from these pumps or from gravity tanks on the roof and with frequent hose outlets near which suitable hose wound on accessible reels is provided. In addition there may be various chemical tanks, tarpaulins to cover goods likely to be damaged by water, axes, buckets, ladders, and other appliances. Fire drills, in order to secure the prompt evacuation of the building by the employees and also to protect property and extinguish fire, are frequently held, and the advantage consists not only in increased safety, but often in reduced insurance premiums. Private fire departments are maintained also by many railway companies, especially for the freight yards, and on the Pennsylvania Railroad an elaborate fire-protection system is arranged with pumps and hose on switching engines and a code of signals to announce an alarm. In large skyscrapers the fire problem is also attacked in similar fashion, and while these buildings are fireproof, yet it is necessary to provide for the protection of the contents, which are usually combustible to a greater or less degree. Hose and standpipes, extinguishers, hooks, axes, as well as alarm boxes, are to be found on every floor, with a complete sprinkler system in many mercantile and office buildings as well as in industrial establishments, and the janitorial force is drilled to act promptly in an emergency. One elevator is always held in readiness for the use of the firemen, as the carrying of their heavy hose up a number of flights is no small undertaking. Private fire protection is becoming almost as important as that given by the local government, and with buildings of increased size and housing of many occupants, as well as large amounts of goods, it is a problem of no small importance.

Bibliography. The most useful sources of information in connection with fire protection are the reports made by such organized bodies as the National Board of Underwriters and the British Fire Prevention Committee. In the case of the publication of the National Board specific reports on the leading American cities are made from time to time and discuss in detail the character of the protection furnished by the various fire departments. The *Quarterly* of the National Fire Protection Association also contains useful information, as do the files of the engineering and insurance press and such papers as *Fire and Water Engineering*, *Municipal Engineering*, *Safety Engineering*, and *Municipal Journal*. Among the works in this field that may be consulted are the following: Shaw, *Fire Protection* (London, 1877), a British presentation of the subject; Hill, *Fighting a Fire* (New York, 1897); Croker, *Fire Protection* (ib., 1913), a timely discussion of fire dangers and the methods of resisting them; Kenlon, *Fires and Fire Fighting* (ib., 1913); O'Reilly (ed.), *Fires and Fire Fighting* (ib., 1911), a simple technical manual for firemen; McKeon, *Fire Prevention* (ib., 1912); Freitag, *Fire Prevention and Fire Protection* (ib., 1912); *Cyclopædia of Fire Prevention and Insurance* (Chicago, 1912); Crosley and Fiske, *Handbook of Fire Protection* (5th ed., Louisville, 1914).

FIRE QUARTERS. See **FIRE BILL**.

FIRES, GREAT CONFLAGRATIONS AND DISASTERS. From a remote antiquity, wherever men have grouped themselves in communities, fire has proved a source of destruction to life and

property, second only to war and disease. Such disasters have not disappeared entirely with the development of civilization and the improved methods of building, maintenance, and dealing with outbreaks of fire. That such is the case may be testified by such conflagrations as those of Baltimore in 1904, San Francisco in 1906, the great Idaho forest fires in 1910, and the Triangle factory fire in New York City, of 1911, where the loss of life was great although the fire itself was confined to the building in which it originated. The fires more notable for the amount of property destroyed and loss of life, of which there is historical record, are given in the accompanying summary on page 604.

FIRE SALAMANDER. The common spotted species of salamander in Europe. See **SALAMANDER**.

FIRE SHIP, or FIRE RAFT. A floating craft, loaded with combustibles, set on fire and sent among the enemy's ships for the purpose of destroying them by fire or causing confusion. The first recorded use of fire ships was at the siege of Tyre (332 B.C.), the Tyrians delaying for some months the fall of their city by destroying with fire ships a mole that Alexander was building. There are numerous other instances of their use before the commencement of the Christian era, and they seem to have been well known from that time onward. The invention of Greek fire in 673 caused increased use of fire ships, at first by the Greeks and afterward by other nations as they became possessed of the secret of manufacture of the compound. In 951, and again in 953, Russian fleets narrowly escaped destruction by fire ships. During the period of the Crusades their use was frequent. In 1370 the English used them at Zuruckzee. The most notable use of them in early modern history, and the first known use of exploding vessels, occurred at the siege of Antwerp in 1585. They were both used against a heavy boom defense, but the employment of the exploding vessels was disastrous to their own side. The English used fire ships against the Spanish Armada at Calais with good effect in 1588. During the seventeenth and eighteenth centuries their use attained a maximum. Soon after the beginning of the nineteenth century the decadence of fire ships began, and the development of steam and the change from wood to iron in shipbuilding have nearly destroyed their usefulness.

FIRE WALK. In several of the Polynesian Islands, notably at Tahiti, is found a fire ceremony intended to insure good crops. Divested of its spectacular features, the ceremony consists of the walking of a priest and other celebrants barefoot across a bed of stones which have been heated upon a mass of burning wood. That this surprising feat, which has been described as a marvel, is susceptible of a rational explanation, has been shown by Secretary S. P. Langley, of the Smithsonian Institution, who observed the ceremony at Tahiti in 1901. It was ascertained that the volcanic rock employed is a poor conductor of heat, so that while the stones of the ceremonial "taro oven" may be intensely hot underneath, the upper part will be only moderately warm. (See *Nature*, Aug. 22, 1901.) A similar ceremony has been practiced in Japan. The stories bordering on the marvelous which have been told about ordeals by fire (see **ORDEALS**) will be found, on examination by competent observers, to admit of simple explanation.

A somewhat analogous mode of procedure has

TABLE OF THE MORE IMPORTANT CONFLAGRATIONS AND FIRES, SHOWING THE EXTENT OF PROPERTY DESTRUCTION AND LOSS OF LIFE.*

Date	Month and day	City	State	Destruction	Loss of life	Loss of property
59	Lyons	Total		
64	July 19-24	Rome	Five-sevenths city		
70	Jerusalem	Burned by Titus	1,100,000	
1137	York	England	Total		
1212	London	England	Nearly all from north to south	3,000	\$20,000,000
1405	Bern	Switzerland	718 buildings		
1491	Dresden	Saxony	Destroyed		
1631	May 10	Magdeburg	Saxony	Nearly destroyed	20,000	
1656	Sept. 2-6	London	England	89 churches, 13,200 houses, 400	6	60,000,000
1702	March 11	Boston	Mass.	100 buildings [streets]	2,000,000
1711	Oct. 2	Boston	Mass.	1,000 buildings	500,000
1728	Copenhagen	Denmark	1,650 houses, 5 churches, univer-		
1729	Constantinople	Turkey	12,000 bldgs. [city, and 4 colleges]	7,000	
1736	Aug. 12	St. Petersburg	Russia	2,000 buildings		
1744	Brest	France	Magazines and stores	35,000,000
1750	Jan. 24	Constantinople	Turkey	12,000 buildings	15,000,000
1752	June 3-6	Moscow	Russia	18,000 buildings		
1756	Cairo	Egypt	50 mosques, etc.	300	40,000,000
1772	Aug. 21	Smyrna	Asia Minor	7,000 buildings	20,000,000
1794	March 1	Copenhagen	Denmark	Royal palace, etc.	100	23,000,000
1805	Nov. 22	St. Thomas Island	West Indies	900 warehouses	30,000,000
1811	Dec. 26	Richmond	Va.	Theatre	70	
1812	Sept. 15	Moscow	Russia	30,800 buildings	20,000	150,000,000
1820	Jan. 10	Savannah	Ga.	463 buildings	8,000,000
1822	Jan. 24	Philadelphia	Pa.	Orphan asylum	23	50,000
1835	Dec. 16	New York	N. Y.	530 buildings	About 800	20,000,000
1836	Feb. 14	St. Petersburg	Russia	Lehmann's Theatre and Circus	5,000,000
1837	Jan. 13	St. John	N. B.	115 houses and business section	35,000,000
1842	May 5-7	Hamburg	Germany	4,219 buildings	10,000,000
1845	April 10	Pittsburgh	Pa.	1,100 buildings	1,670	
1845	May 25	Canton	China	20	4,000,000
1845	May 28	Quebec	P. Q.	1,500 buildings	20	8,000,000
1845	June 28	Quebec	P. Q.	1,300 buildings	40	6,000,000
1845	July 20	New York	N. Y.	300 buildings	6	5,000,000
1846	June 12	St. John's	Newfoundland	6,000 homeless	About 100	2,000,000
1846	June 14	Quebec	P. Q.	Theatre Royal	63	1,500,000
1847	Feb. 28	Carlsruhe	Germany	Theatre	15,000,000
1848	Aug. 16	Constantinople	Turkey	3,000 buildings	5,000,000
1848	Aug. 17	Albany	N. Y.	600 buildings, steamship pier, etc.	7,000,000
1848	Sept. 9	Brooklyn	N. Y.	300 buildings	5,000,000
1849	May 17	St. Louis	Mo.	15 blocks, 23 steamships	5,000,000
1852	July 8	Montreal	P. Q.	1,200 buildings	5,000,000
1852	Nov. 2	Sacramento	Cal.	Total, 20,000 homeless	5,000,000
1854	Oct. 5	Gateshead	England	Warehouses	50	5,000,000
1857	June 7	Leghorn	Italy	Teatro degli Aquidotti	40 to 100	
1860	Jan. 10	Lawrence	Mass.	Pemberton Mill	500	
1861	June 21	London	England	Wharves, etc.	10,000,000
1862	May 10	Troy	N. Y.	871 buildings	3,000,000
1863	Dec. 8	Santiago	Chile	Jesuit church	2,000	
1866	July 4	Portland	Me.	One-half city, 2,000 homeless	10,000,000
1869	Aug. 4	Philadelphia	Pa.	Bonded warehouses with whisky	3,500,000
1870	June 5	Constantinople	Turkey	7,000 buildings	25,000,000
1871	Sept. and Oct.	Forest fires, Mich., Wis., and Minn.	750 square miles, 17,430 buildings	11,000,000
1871	Oct. 9	Chicago	Ill.	2,000 acres, 776 buildings	250	165,000,000
1872	May	Tientsin	China	Theatre	600	
1872	Nov. 9	Boston	Mass.	65 acres	75,000,000
1876	Sept. 3	St. Hyacinthe	P. Q.	Nearly destroyed	15,000,000
1876	Dec. 5	Brooklyn	N. Y.	Conway's Theatre	283	
1877	June 21	St. John	N. B.	Two-fifths city	15,000,000
1881	March 23	Nice	France	Théâtre Municipal	70	
1881	Dec. 8	Vienna	Austria	Ring Theatre	450	
1882	Dec. 11	Kingston	Jamaica	600 houses and wharves	10,000,000
1883	Jan. 13	Berditschhoff	Russian Poland	Theatre	270	
1887	May 25	Paris	France	Opéra Comique	70 to 100	
1887	Sept. 5	Exeter	England	Exeter Theatre	86	
1888	March 31	Oporto	Portugal	Theatre	170	
1889	June 6	Seattle	Wash.	Business section	6,628,000
1892	July 8	St. John's	Newfoundland	Greater part of city	25,000,000
1892	Oct. 23	Milwaukee	Wis.	600 buildings	4,944,300
1896	Oct. 5	Guayaquil	Ecuador	Half of city	22,000,000
1897	May 4	Paris	France	Charity Bazar	124	
1900	June 30	Hoboken	N. J.	Steamship piers and vessels	215	4,627,000
1900	April 26	Ottawa and Hull	Ontario	About two square miles	15,000,000
1901	May 3	Jacksonville	Fla.	148 blocks	10,500,000
1902	Feb. 9	Paterson	N. J.	456 buildings	5,817,305
1903	Dec. 30	Chicago	Ill.	Iroquois Theatre	574	
1904	Feb. 7	Baltimore	Md.	140 acres, 2,500 buildings	50,000,000
1904	April 20	Toronto	Ontario	14 acres leveled, 8 more damaged	12,000,000
1906	April 18	San Francisco	Cal.	2,593 acres (4.05 square miles)	350,000,000
1908	April 12	Chelsea	Mass.	492 acres	6,000,000
1911	March 29	Albany	N. Y.	Capitol	5,500,000
1911	March 25	New York	N. Y.	Triangle shirt-waist factory	147	
1911	July 10-12	Porcupine District	Ontario	Mining and lumber property	400	3,500,000
1911	April 30	Bangor	Me.	Conflagration	3,500,000
1912	Jan. 9	New York	N. Y.	Equitable Building	3,000,000
1912	Feb. 21	Houston	Tex.	Cotton compresses and other bldgs.	4,500,000
1914	June 25-6	Salem	Mass.	1,700 buildings, 253 acres	14,000,000

* The figures in this table must be regarded in many cases merely as approximate, as an accurate statement of property destruction and loss of life is rarely forthcoming even in the case of modern conflagrations, not to mention those of which there exist only historical records. The statistics given, however, are useful as fixing the dates and comparative destruction of some of the world's great disasters by fire.

been noted among a number of North American Indian tribes. A fire is built, the glowing coals are spread, and the dancers then begin to dance, rushing into the fire and stamping it out. This performance has been described by the Prince of Wied, *Reise in das innere Nord-America*, ii, pp. 144, 218, 241 (2 vols., Coblenz, 1839-41), as the "Hot Dance" of the Mandan, Arikara, and Hidatsa. Among the Arapaho and Gros Ventre it has been noted as part of the Crazy Dance ceremony in Kroeber, "The Arapaho," *Bulletin of the American Museum of Natural History*, XVIII, p. 190; id., "Ethnology of the Gros Ventre," *Anthropological Papers of the American Museum of Natural History*, i, p. 245.

FIREWEED. See *EPILOBIUM*.

FIREWORKS. See *PYROTECHNY*.

FIREWORM. A caterpillar which devours foliage, leaving the trees looking as if a fire had swept over them. The spring cankerworm (q.v.) and the *Rhopobota vacciniæ* are examples.

FIRE WORSHIP. Devotion paid to fire as a sacred element, and one of the earliest forms of worship among mankind. This widespread cult, like sun worship, earth and water veneration, may be recognized in many phases from primitive ages to the present day, from savagery to civilization. A distinction between the primitive fetish worship of the physical fire itself and the more advanced conception of a divinity or fire god behind the flaming manifestation is not always easy to draw among the nations that have paid reverence to this element. It is easy, however, to see how fire, as an incarnation of light opposed to darkness, and as a power so beneficent and yet on occasion maleficent, would be a natural object of veneration. Nor is it difficult to understand the devoted care and pious attention early bestowed upon the cherished flame sprung from the spark so hard to obtain and so difficult to maintain. It was this that made the fire, which was preserved for the general good on an altar or in a shrine, the focus of the early community and made the domestic hearth the centre and symbol of the home and family. Special functions or time-honored rites were associated with the production and keeping of the fire, and those who ministered upon it, as its worship developed, came to be holy and powerful priests, as the guardians of a divine gift.

The savage tribes of American Indians, like the rude natives of West Africa, paid homage to a fire spirit as ancestor, and, as Tylor has pointed out, the Polynesians and Mexicans acknowledged in their worship a fire god akin to the divinity of the sun. The worship of Moloch in ancient Canaan was a form of homage to the genius presiding over fire; and hallowed rites to the fire were performed among the Egyptians, Assyrians, Chaldeans, and the less civilized Mongolian tribes.

Nearer to our own race, however, was the veneration shown for fire among the early Indo-Germanic peoples. In India of old, e.g., there was an elaborate fire ritual; sacrifice to the fire was one of the first acts of morning devotion; and the hymns addressed to the fire god Agni (q.v.) in the Rigveda outnumbered those in praise of any other divinity. In Greece and Rome likewise, the fire cult of Hestia or Vesta, and of Hephestus or Vulcan, was a marked feature in the religion. The Slavic race, including Old Prussians, Lithuanians, and Russians, preserve reminiscences of earlier fire worship. Among the ancient Celts, Brigit was worshiped

particularly as the goddess of fire and fertility. But in this respect most important among the members of the Indo-European family are the Persians.

In Iran from the earliest times the care of the fire was so scrupulous and so elaborately developed that it formed the most noticeable characteristic of the ancient Persian faith. The religion of Zoroaster (q.v.) is sometimes, therefore, called fire worship, but erroneously, as the Parsis or modern adherents of the creed insist. It is certain that in the *Avesta* (q.v.) the fire played a most prominent rôle; it was personified as the "Son of Ormazd," and inconceivable pains were taken to preserve the sacred element from defilement. The regular name for a priest in the Zoroastrian scriptures is *āthrauan*, 'belonging to the fire'; and Greek writers describe how the fire was carried in state processions before the Persian kings, for it was a symbol of the divine presence and of national feeling. The extinction of the holy flame in the temples, when the Mohammedans conquered Persia, was synonymous with the downfall of Iran. The sacred fire which the Parsis (q.v.) carried with them from Persia to India when they fled as religious exiles was to them an outward sign of their nationality as it was of their faith—a palladium of the worship of Ormazd. As Zoroastrianism apparently sprang up first in the neighborhood of the Caspian Sea with its oil wells and petroleum fountains, one may imagine that this fact may have had some influence on the early Persian faith, and there are Parsis or Ghebers (q.v.) that still do reverence to the eternal flame that leaps from the earth at Baku on the Caspian shore. It is interesting to add that near Rawalpindi in northern India there is a sacred fire cherished by Mohammedans, which is unusual for Islam, and it has been supposed that this may show evidence of influence exerted by early Persian fire worship combined with the old fire cult of India itself. Whatever may have been in olden times the feeling or attitude of the Persians in their worship or veneration of fire, or whatever were the views that made the victorious Mohammedans brand them as idolaters and fire worshippers, the modern Zoroastrians of India reject such a title and emphasize that they look upon fire as a sign or symbol, as a manifestation of the divine power, purity, and essence. It may be added, in conclusion, that *pyrolatry* as a scientific designation is sometimes employed to designate fire worship. Consult: Tylor, *Primitive Culture* (2 vols., New York, 1889); A. Kuhn, "Herabkunft des Feuers," in his *Mythologische Studien* (2d ed., Gütersloh, 1886); Zaborowski-Moindron, "Le feu sacré et le culte du foyer des Slaves contemporains," in *Société d'Anthropologie de Paris Bulletins et Mémoires*, series 5, vol. i, pp. 530-534 (Paris, 1900); MacCulloch, *Religion of the Ancient Celts* (Edinburgh, 1911); Macdonell, *History of Sanskrit Literature* (London, 1913).

FIRE WORSHIPERS. See *GHEBERS*.

FIRISHTAH, fê-rêsh'tâ, MUHAMMAD QASIM HINDŪ SHĀH (?1570-?1612). A celebrated Persian historian. He was born at Astrabad on the Caspian Sea. At a very early age he went with his father (Ghulam Ali Hindū Shāh) to India, where we find him, when 12 years old, at Ahmednagar in the Deccan. He afterward became captain in the bodyguard of Murtadah Nizam Shah; and when this King was deposed by his own son, Firishtah went to Bijapur (998 A.H., 1589 A.D.), where Ibrahim 'Adil Shah II,

the reigning monarch, received him with great honor. Soon after his arrival Firishtah is mentioned as taking part in an action against Jamal Khan, in which the historian was wounded and taken prisoner; but ere long he made his escape. His death is supposed to have taken place shortly after the year 1612. His great work is the *Tarikh i Firishtah*, a history of the Mohammedan power in India. Written with an impartiality, simplicity, and clearness rare in an Eastern work, this history has become a standard work on the subject, into which it was the first to enter at length. Single portions of it have been translated by Dow, Scott, Stewart, Anderson, etc.; but the whole work was first edited by Briggs (Bombay, 1831), and also translated by him under the title *The History of the Rise of the Mahomedan Power in India* (4 vols., London, 1829; republished ib., 1908-10), which consult for a brief biography.

FIRKIN (ODan. *firken*, multiple of four, from *fire*, four, OHG. *fior*, *fier*, Ger. *vier*, Goth. *fidwor*, AS. *fēower*, Eng. *four*; connected with Ir. *cethir*, OChurch Slav. *chetyri*, Lith. *keturi*, Lat. *quattuor*, Oscan *petur*, Gk. *τέσσαρες*, *tessares*, Skt. *catur*, four). An old British measure of capacity for liquids, dating from about the fifteenth century, containing nine gallons, or corresponding to one-quarter of the old beer barrel of 36 gallons. It had two values, also being taken at eight gallons in old ale measure. In the United States the term "firkin" is applied to a wooden container or receptacle used for butter or lard, in which the contents are sold usually on the basis of weight. See WEIGHTS AND MEASURES.

FIRMAMENT (Lat. *firmamentum*, from *firmare*, to strengthen, from *firmus*, firm). A word used to denote the vault of heaven. The term found its way into English from the Vulgate, which renders the Septuagint σφαιρωμα, *sphereōma*, and the Hebrew *raq'ia* by the Latin *firmamentum* (Gen. i. 6). *Raq'ia* (from the verb *raga'*, to extend) signifies whatever is beaten or stretched out, and was especially employed by the Hebrews to denote the hemisphere above the earth, compared (Ex. xxiv. 10) to a splendid and pellucid sapphire. Elsewhere (Ezek. i. 22-26) it is spoken of as the "floor" on which the throne of the Most High is placed. Hence it follows that the notions of solidity and expansion were both contained in the Hebrew conception of the firmament (Job xxxvii. 18). The blue ethereal sky was regarded as a solid sphere, to which the stars were fixed, and which was constantly revolving, carrying them with it. This sphere, or firmament, rested on the loftiest mountains as pillars and divided the waters which were under the firmament from the waters which were above the firmament; and the theory of the phenomena of rain, etc., was that there were "windows in heaven"—i.e., in the firmament—through which, when opened, the waters that were above the firmament descended (Gen. vii. 11; 2 Kings vii. 2, 19; Ps. lxxviii. 23 and cxlviii. 4). Similarly, under the earth there was another sea, called the "deep" or "great deep." The view entertained by the Greeks and other early nations was essentially the same. In the progress of astronomical observations it was found that many of the heavenly bodies had independent motions inconsistent with the notion of their being fixed to one sphere or firmament. Then the number of crystalline spheres was indefinitely increased, each body that was clearly

independent of the rest having one assigned to it, till a complex system was introduced capable of being fully understood only by the philosophers who devised it. See PTOLEMAIC SYSTEM.

FIRMAN, *fēr'man* or *fēr-mān'* (Turk. *fermān*, Pers. *farmān*, Skt. *pramāṇa*, authority, norm, from *pra*, forth + *mā*, to measure). A word used by the Turks to denote any official decree emanating from the Ottoman Porte, usually for the purpose of providing protection and assistance for a traveler, or to sanction an enterprise and prescribe its conditions. Its employment in Persia is as old as the time of Darius, who in the Old Persian inscription speaks of his commands or statutes as *framāna*. The right of signing any firman relating to affairs connected with his special department is exercised by every minister and member of the Divan, but the office of placing at the head of the firman the *thogrāi*—a cipher containing the name of the Sultan in interlaced letters, which alone gives effect to the decree—is committed to the hands of a special minister, who is called *nichanji effendi*. The name applied to such decrees as have been signed by the Sultan himself is *hatti-sherif* (q.v.). The name "firman" may also signify a more formal kind of Turkish passport, which can be granted only by the Sultan or by a pasha. A written permission to trade is also called in India a firman.

FIRMENICH-RICHARTZ, *fēr'me-nīk rēk'ärts*, JOHANNES MATTHIAS (1808-89). A German author and Germanic scholar, born in Cologne and educated at Bonn and Munich. He was also known as a playwright and poet. In 1860 he was appointed professor in Berlin, where he published his principal work, *Germaniens Völkerstimmen. Sammlung der deutschen Mundarten in Dichtungen, Sagen, Märschen, Volksliedern*, etc. (3 vols., 1843-66; supplementary volume, 1867).

FIRMIAN, *fēr'mē-ān*, KARL JOSEPH, COUNT (1716-82). An Austrian statesman, born at Deutschmetz, Tirol, and educated at Erthal, Innsbruck, Salzburg, and at the University of Leyden. He was sent by Maria Theresa as Ambassador to Naples in 1753 and as Governor-General to Lombardy in 1756. He was a patron of Winckelmann, of Angelica Kauffmann, and of many other scholars and artists. Many libraries were established by him, while his own collection (the "Bibliotheca Firmiana") of 40,000 volumes (catalogue in 10 vols., 1783) was always accessible to investigators and was later in part incorporated with the Brera Library in Milan.

FIRMICUS MATER-NUS, JULIUS. A Latin author of the fourth century, a native of Sicily, who about 336 A.D. wrote eight books on astrology (*Matheseos Libri VIII*), in which he formulated a complete theory of astronomical superstition in the spirit of the Neoplatonists; the work shows some acquaintance with Christianity. The work was first published in the *Astronomici Veteres* (1499) and subsequently by Pruckner (1533 and 1551). Other editions are by Sittl (1894), and, finally, by Kroll, Skutsch, and Ziegler (2 vols., 1897, 1913). Later, about 347 A.D., he addressed to the sons of Constantine the Great a work entitled *De Errore Profanarum Religionum*, treating of the false fanaticism of paganism and counseling its complete annihilation. This work was edited by Halm, in vol. ii of the *Corpus Scriptorum Ecclesiasticorum Latinorum* (Vienna, 1867), and by

Ziegler (Kempten, 1913). Consult Teuffel, *Geschichte der römischen Litteratur*, §§ 406-407 (6th ed., Leipzig, 1911), and Jordan, *Geschichte der altchristlichen Litteratur* (ib., 1911).

FIRMILIAN. A dramatic poem by W. E. Aytoun (1854).

FILMIN, THOMAS (1632-97). An English philanthropist, born at Ipswich. In 1662 he raised money for the Polish exiles of the Unitarian belief and in 1681 for the Polish Calvinists when they shared the same fate. But he was better known for his charities at home, and especially for the employment he provided (1665) in London to help needy workmen after the plague, and again in 1666 after the great fire. From 1676 he devoted himself entirely to philanthropic schemes of various kinds. He built a linen factory, where a little later he employed 1700 workmen, and in 1682 he established a second factory at Ipswich to help the refugees from France, besides making large collections for them. From 1673 to his death he was a governor of Christ's Hospital, save for a break caused by his opposition to James II. In politics he seems to have been Republican, but was an ardent admirer of William III; and in theology he was an anti-Trinitarian, though he never left the English church. He wrote *Some Proposals for the Employing of the Poor, especially in and about London, and for the Prevention of Begging* (1678; reprinted in 1681, and in 1787 in *Tracts Relating to the Poor*).

FIRMINY, fêr'mè'nè'. A town in the Department of Loire, France, 45 miles by rail from Lyons (Map: France, S., J 3). It is situated in a coal-mining region and manufactures steel and iron, also woolen goods and ribbons. Pop. (commune), 1901, 16,903; 1911, 19,580.

FIRMISTERIA, fêr'mî-stêr'ni-â. A division of the tailless Amphibia (Anura), which includes those tongue-possessing frogs (the families Ranidæ and Engystomatidæ), in which the two halves of the shoulder girdle meet in the middle line and form a firm median bar. (This is contrary to the case in the correlative division Arcifera, in which the two halves of the shoulder girdle overlap on the ventral side and are to some extent movable upon each other, allowing the thorax to expand and contract.) The firmisternal type "is morphologically the higher and more recent and passes in the larval stage through the arciferous condition." It is characteristic also of the Aglossa (q.v.). Cope and Boulenger regard the Firmisternia and Arcifera as a suborder, equivalent to the Aglossa and others; but the latest revision of the classification of the Anura (Gadow, 1901) makes Firmisternia and Arcifera divisions of the suborder Phaneroglossa, or tongue-bearing frogs and toads. The Phaneroglossa and the Aglossa constitute the Anura. Consult Gadow, *Amphibia and Reptiles* (London, 1901).

FIROZPUR. See FERROZPORE.

FIRST AID TO THE INJURED. See ANTIDOTE; ASPHYXIA; BLEEDING; RESUSCITATION; RESPIRATION, ARTIFICIAL.

FIRST-BORN (translation of Heb. *bekor*, from *bakar*, to break forth). In biblical usage, a term which signifies the first male offspring, whether of man or of other animals. The first-born male was devoted from the time of birth to God. In the case of first-born male children the law required that within one month after birth they should be redeemed by an offering equivalent in value to five shekels of silver (Ex. xiii.

13; Num. xviii. 15-16). If the child died before the expiration of 30 days, the obligation of redemption ceased; but if that term were completed, the obligation was not extinguished by the subsequent death of the infant. This redemption took place according to a fixed ceremonial. It is difficult to say in how far these laws of redemption point to the existence in earlier days of the actual offering of the first male child to a deity. Traces of such offerings are found, but the instances appear to be exceptional—as in moments of great danger (2 Kings iii. 27; cf. also 2 Kings xxi. 6). On the other hand, the narrative of Abraham's readiness to sacrifice Isaac would lose part of its meaning if the rite was really resorted to only under exceptional circumstances. The rite of circumcision has also been considered by some scholars as a modification of an original offering of the first-born; but it is also likely that the symbol replacing the reality was introduced at a comparatively early age.

The first-born male of animals also, whether clean or unclean, was equally regarded as devoted to God. The first-born of clean animals, if free from blemish, was to be delivered to the priests within 12 months after birth to be sacrificed to the Lord (Deut. xv. 19-21); nor was it permitted to any but the priests to partake of the flesh of such victims (Num. xviii. 15-19). If the animal was blemished, it was not to be sacrificed, but to be eaten at home (Deut. xv. 22). The first-born of unclean animals, not being a fit subject for sacrifice, was either to be put to death or to be redeemed with the addition of one-fifth of its value (Lev. xxvii. 27; Num. xviii. 15). If not redeemed, it was to be sold, and the price given to the priests.

Primogeniture, both by the patriarchal custom and by the Pentateuchal codes, had certain privileges attached to it, the chief of which were the headship of the family and a double portion of the inheritance (cf. Deut. xxi. 16, 17). "First-born" was a title of honor or affection (Ex. iv. 22; Jer. xxxi. 9). The Hebrews shared with the other Semites a belief in the sanctity of first fruits in general which may properly be traced back to a natural feeling of rejoicing and gratitude. Hence, even among Semites in a nomadic state, special privileges are accorded to the first-born, and to barter away one's birthright was regarded as a disgrace. In this respect the story of Esau's selling his birthright for a mere mess of pottage—an act which the writer holds up to scorn (Gen. xxv. 29-34)—well reflects the general view. As a people advances from the nomadic to the pastoral and thence to the agricultural stage, the views connected with the first-born are naturally extended to animals and to produce of the fields. Hence, in the Pentateuchal codes, which are based on the agricultural stage, ample provisions are made for rites connected with the various classes of "first" productions. See FIRST FRUITS; FAMILY; SUCCESSION; PRIMOGENITURE.

FIRST FRUITS (translation of Heb. *reshith*, or *bikkurim*, first, best). That portion of the fruits of the earth, and other natural produce, which, by the usage of the Hebrews and other ancient nations, was offered to the Deity, as an acknowledgment of His supreme dominion and a recognition of His bounty. (Consult Frazer, *Golden Bough*, vol. ii, London, 1890.) Among the Hebrews the institution of first fruits com-

prised both public and private offerings. The regulations are set forth in the several codes of the Pentateuch. Taking these codes together, the regulations may be summarized as follows:

Of the public class there were three principal offerings. The first was at the opening of the corn harvest. On the day after the first day of the Passover, the 16th of the month Nisan, a sheaf of new corn, which was cut and gathered with much solemnity, was carried to the holy place and there waved before the altar (Lev. xxiii. 40 et seq.); nor was it permitted to commence the harvest work till after this solemn acknowledgment of the gift of fruitfulness. Again, at the Feast of Pentecost, seven weeks later, two loaves of leavened bread, made from the flour of the new harvest, were waved, with a similar form of worship, before the altar (Ex. xxxiv. 22; Lev. xxiii. 15-17). Thirdly, at the Feast of Tabernacles, in the seventh month, was held the great feast of the completed harvest, the final acknowledgment of the bounty of God in the fruits of the year (Ex. xxiii. 16; Lev. xxiii. 33-34).

Besides these public offerings of first fruits on the part of the entire people, individual Hebrews were bound to private offerings, each upon his own behalf. A cake of the first dough, one-twenty-fourth of the amount, was to be offered to the Lord (Num. xv. 21). The "first of all the fruits" were to be placed in a basket and carried to the appointed place, where the basket was to be offered with a prescribed formula, commemorative of the sojourn of Israel in Egypt and of his deliverance by the strong hand (Deut. xxvi. 2 et seq.). Fruit trees were given three years for growing, then the fruit of the fourth year was to be given to God (Lev. xix. 23-25). All these offerings were divided into two classes. The first, which were called *bikkurim*, comprised the various kinds of raw produce, of which, although the law seems to contemplate all fruits, seven sorts only were considered by the rabbis to fall under the obligation of first-fruit offering, viz., wheat, barley, grapes, figs, pomegranates, olives, and dates. He who lived near Jerusalem brought fresh fruits; others could bring them dried. It was customary for offerers to make their oblations in companies of 24 and with a singularly striking and effective ceremonial. The second class, the *reshith*, were brought of prepared materials, dough, wine, oil, etc. The *terumoth* were taxes consisting in the first ripe of the fruit, whether of the ground or of trees, levied for the support of the priests. There was no definite amount. Between one-fortieth and one-sixtieth of the harvest could be given, but it does not appear that this regulation was ever strictly carried out except by a small minority of pious devotees, just as various other provisions remained a dead letter. With the destruction of the second temple all offerings and sacrifices were abolished, though among orthodox Jews, as a reminiscence of the temple cult, a portion of the dough for baking bread is still thrown into the fire.

Offerings analogous to the Jewish first fruits became usual very early in the Christian Church, as is clear from passages in Irenæus (*Adv. Hæc.* iv, 17 and 34); but the extent to which they prevailed, and the amount and general character of the oblation, are exceedingly uncertain. It appears to have been merged in the legal provision established by the emperors.

The mediæval ecclesiastical impost known under the name of *primitiæ*, or first fruits, and sometimes of *annates* or *annalia*, was entirely different. By the word, in its mediæval and modern sense, is meant a tax imposed by the popes on persons presented directly by the Pope to those benefices which by the canonical rules, or in virtue of privileges claimed by them, fall within the papal patronage. Persons so presented were required to contribute to the Roman see the first fruits (i.e., the income of the first year) of their benefice. During the residence of the popes at Avignon, when the papal necessities compelled the use of every means for eking out a precarious revenue, it was sought to extend the impost to every benefice; and this claim was the subject of many contests, especially in Germany and in England, where the claim, so far as regarded direct papal presentation, had existed from the reign of King John. Henry VIII withdrew the right of the first fruits from the Pope in order to transfer it to the King; and he established a special court for the administration of first fruits, which, however, was soon abandoned. In the reign of Anne the revenues arising from this impost in England were vested in a board, to be applied for the purpose of supplementing the incomes of small benefices. In France this tax was abolished by the "pragmatic sanction" enacted at Bourges in 1438 and subsequently by the concordat of Leo X with Francis I in 1516. In Spain it ceased partially in the reign of Ferdinand and Isabella and finally under Charles V. In Germany it formed one of the first among the *centum gravamina* presented to the Emperor in 1521, and the claim ceased altogether from that period. Consult the Hebrew *Archæologies* of Nowack (Freiburg, 1894) and Benzinger (2d ed., Tübingen, 1907), and Robertson Smith, *Religion of the Semites* (London, 1894). See FIRST-BORN.

FIRST GENTLEMAN OF EUROPE. A title given to the Prince Regent, afterward King George IV of England.

FIRST GRENADIER OF FRANCE. A title given to Latour d'Auvergne (q.v.).

FIRST LIEUTENANT OF A MAN-OF-WAR. See LIEUTENANT, FIRST, under head of LIEUTENANT.

FIRTH, or **FRITH** (from Icel. *fjörþr*, ford; connected with Lat. *portus*, port, Skt. *par*, to cross). A name used in Scotland for deep inlets of the sea, in many cases of estuarine formation. The term "firth" is similar to the Norwegian "fiord," an inlet with high rocky walls; the Scottish firths often have the characteristics of fiords. See ESTUARY; FIORD.

FIRTH, CHARLES HARDING (1857-). An English historian, born in Sheffield. He studied at Clifton College and at Balliol College, Oxford, where he became a scholar in 1876 and an instructor in 1883. From 1887 to 1893 he was a lecturer at Pembroke College, Oxford; in 1900 he became Ford's lecturer in English history in the University of Oxford, in 1901 fellow of All Souls' and in 1904 of Oriel, and in the last-named year he was made regius professor of modern history. His special field was the Civil War and the Protectorate, and, besides contributions on this period to the *Dictionary of National Biography*, he wrote: *Oliver Cromwell and the Rule of the Puritans* (1900); *Cromwell's Army* (1902); *The Last Years of the Protectorate* (1909); *The House of Lords during the Civil War* (1910). He edited a number of historical

and biographical works, among which are: *Memoirs of Edward Ludlow* (1892); *Memoir of the Life of Colonel Hutchinson* (1896); *Scotland and the Commonwealth; Letters and Papers Relating to the Military Government of Scotland, 1651-53* (1895); and its sequel, *Scotland and the Protectorate, 1654-59* (1899). He edited (1914-)

FIRUZABAD, fê-rûz'zâ-bâd. A Sassanian palace, 65 miles from Shiraz, built by Firuz II (fifth century). The length was about 342 feet and the breadth 178. The plan of the building was rectangular, the entrance being on the north side, where there was a great porch. Within there were reception rooms; behind

PALACE OF FIRUZABAD.

an illustrated edition of Macaulay's *History of England*.

FIRTH, MARK (1819-80). An English steel manufacturer and philanthropist, born at Sheffield. He left school at the age of 14 to enter the steelworks where his father was employed. In 1843 he and his father established a small foundry, which soon became very extensive and acquired a considerable trade in America. They built huge works at Sheffield in 1849. The firm manufactured steel blocks for ordnance, spherical and elongated shot, and every variety of heavy forgings for engineering requirements. The manufacturing and refining of steel from Swedish iron was successfully carried on, and nearly all the steel used in making English guns was produced by this firm. Firth was also celebrated as a public benefactor. His numerous gifts and endowments include the Mark Firth's Almshouses at Ranmoor, erected at a cost of £30,000, and consisting of 36 houses, left as a permanent legacy to the poor of Sheffield; a freehold park of 36 acres for a recreation ground (opened by the Prince and Princess of Wales, Aug. 16, 1875), and the Firth College, erected at a cost of £20,000 and furnished with an annual endowment of £5000 (opened by Prince Leopold, Oct. 20, 1879).

FIRTH OF FORTH. See FORTH.

FIRUZ I, fê'rûz. One of the Arsacide kings of Persia, who reigned 78-103. He is also called Arsaces XXIV, King of Parthia, and is identified with Pacorus II of the classical writers.

FIRUZ II (457-484), or Pêrôz. A king of Persia, of the Sassanide dynasty, son of Yazdegerd II. He overthrew and put to death his younger brother, Ormazd (or Homizd) III, and so came to the throne. The reign of Firuz was unhappy, though he succeeded in being at peace with the Romans. The Ephtalites, or White Huns (so called to distinguish them from the true Huns), threatened the kingdom. The Persians undertook two expeditions against them, but were unsuccessful in both, and in the second one Firuz and 29 of his sons perished.

FIRUZ III (?-679). The last of the Sassanides of Persia. He was expelled from Persia by the new Mohammedan power on the defeat of his father, Yazdegerd III, in the battle of Nehavend, about 641, and took refuge with the Emperor of China, Kao-Tsung, who vainly endeavored to restore him to the Persian throne.

these, three square rooms, side by side, each having a vaulted dome, and behind these an open court surrounded by vaulted chambers. The massive walls were constructed of rough stone, the vaulting was of brick, and plaster was used to finish off the surfaces. The general style of architecture shows traces of Mesopotamian, Byzantine, and Roman influences, the particular features being copies of decorations in Persian palaces, the use of blind arches, and a zigzag molding of projecting bricks.

FIRUZABADI, fê'rûz-zâ-bî'dé, MEDJED ED-DIN (1329-1414). A Mohammedan lexicographer, born at Karazin, near Shiraz. Several educational institutions at Medina and Mecca were founded by him. Three years after his meeting with Timur at Shiraz (1382) he was appointed chief cadi of Yemen, which position he retained until his death. He achieved celebrity through his great lexicographical work *Qamus* ("The Ocean"; best ed. by Nasr al-Hurini, 4 vols., 1301-02 of the Hegira). The work has also been translated into Turkish (3 vols., 1230-40 A.H.) and Persian (Calcutta, 1840 A.D.).

FIRUZ SHAH I, RUKN UD-DIN. A Mohammedan king of Delhi. He succeeded his father, Shams ud-Din Altamsh, in 1236 A.D., after having been governor of Lahore. He was deposed after a reign of seven months and was succeeded by his sister, the Sultana Razziya, or Raziyat-ud-Din ('Devoted to the Faith'). Consult Lane-Poole, *Medieval India under Mohammedan Rule* (New York, 1903).

FIRUZ SHAH II, JALAL AD-DIN (?-1296). The founder of the Khalji dynasty of the Mohammedan sultans of Delhi, a magnanimous ruler, who succeeded to the throne in 1290 at the age of 70. His rare clemency and humility were exasperating to his followers, who desired a fighter and not a lover of art and learning as he proved to be. He freely forgave Chhaju, a nephew of Balban, and his rebel followers, after they had attempted to overthrow him, and even went so far as to refuse to execute the members of a society of assassins, whom he merely banished to Bengal. That he was brave in battle is obvious from his campaign against the Mongols on the Indus in 1292. In 1296 he was drawn unarmed into a trap and basely assassinated by his nephew, Ala-ad-Din, who two months later succeeded to the throne. Consult Lane-Poole, *Medieval India under Mohammedan Rule* (London, 1903).

FIRUZ SHAH III (1296-1388). King of Delhi. He succeeded Mohammad II ibn Taghlak III in 1351. A most merciful and pious ruler, his reign was tranquil and his country prosperous. In 1386 he abdicated, and two years later he died.

FISC (Fr. *fisc*, from Lat. *fiscus*, treasure chest). The public treasury. The Latin term was originally applied to the private purse of the Emperor, to distinguish it from the public treasury, or *aerarium*. Later it came to designate the Imperial treasury, in contradistinction to the private property of the ruler, in which sense it is employed in modern countries whose jurisprudence is derived from the civil law. The *fisc* has, in Roman fashion, been personified and is in law considered as an ideal or juristic person. It has a legal right to all the state revenues, including those derivable from forfeitures. In suits against it by a subject, all questions of doubt are to be resolved in favor of the subject. Consult: Bracton, *De Legibus et Consuetudinibus Angliæ* (Twiss ed., London, 1878-83); Spelman, *Glossarium Archæologicum* (ib., 1867); Molina v. *United States* (6 *Court of Claims Reports*, 209, 1870); Sohm, *Institutes of Roman Law* (2d ed., Oxford, 1901).

FISCANNUM. See **FÉCAMP**.

FISCHART, fish'ärt, JOHANNES (c.1545-c.91). The great German satirist of his century, also a Protestant reformer. A doctor of the University of Basel (1574), his literary activity was confined chiefly to the years 1575-81, after which he became absorbed in his duties as advocate at the Imperial court at Speyer, and as local magistrate (1583) at Forbach, where he died. Some 50 of the satires attributed to him are authentic. They are directed against the Pope, the Jesuits, vicious priests, the aristocracy, pedants, astrologers, and folly of every kind. His most famous works are the Rabelaisian *Aller Praktik Grossmutter* (1572); *Eulenspiegel Reimensweis* (1571); *Affentheurliche und ungeheuerliche Geschichtschrift . . . von Gargantua und Pantagruel* (1575); the coarsely comic parody of the animal epic, *Flüh-hatz, Weibertratz* (1574); the anticlerical *Bien-enkorb des heiligen römischen Iemenschwarms* (1579, suggested by the *Bynenecor* of the Dutch Marnix); *Der heilige Brotkorb* (1580), an imitation of Calvin's *Traité des reliques*; *Das vierhörnige Jesuiterhütlein* (1580); the genially comic *Das glückhafte Schiff von Zurich* (1576; ed. by Baechtold, 1880). His poems were edited by Kurtz (Leipzig, 1866-68). Consult studies of Fischart by Wackernagel (Basel, 1875), Wendeler (Halle, 1879), and Besson (Paris, 1889).

FISCHBACH, fish'bäg, FRIEDRICH (1839-1908). A German textile designer, born at Aix-la-Chapelle. He was educated at the Academy of Industrial Design in Berlin and in 1862 went to Vienna, where he worked as decorator and designer. In 1870 he was appointed teacher of ornamentation at the Royal Academy in Hanau. He was director of the newly organized Industrial Art School at Saint-Gall from 1883 to 1888, and in 1889 settled in Wiesbaden, Germany. Several societies for the advancement of industrial art were established by him, and he was influential in the development of textile design in Germany. His collection of antique fabrics and embroideries was acquired by the Metropolitan Museum, New York, in 1909. His principal literary works include: *Ornamente der Gewebe* (with 160 colored plates, 1874-81);

Geschichte der Textilkunst (1883); *Südslavische Ornamente* (2d ed., 1872); *Album für Stickerei* (130 patterns, printed in gold and colors; later eds., 1872 and 1880); *Neue Muster für Stickerei und Häkelarbeiten* (3 series, 1880-83); *Stickereimuster* (4 parts, 1888); *Häkelvorlagen* (1889); *Weisstickereivorlagen* (1892); *Die wichtigsten Webemuster bis zum 19ten Jahrhundert* (1900).

FISCHER, fish'ēr, ABRAHAM (1850-1913). A South African public official, born at Green Point, Cape Town, and educated at the South African College. Participating in the politics of Orange Free State, he became a member of its Volksraad in 1878 and of its Executive Council in 1896, and also served in various colonial and interstate conferences. During the South African War he was president of the joint deputation of the Transvaal and Orange Free State to Europe and America. He served as chairman of the Orangia Unie; held the premiership of the Orange River Colony from 1907 to 1910; and after the Union of South Africa was formed he became Minister of Lands in 1910, Privy Councillor in 1911, and Minister of the Interior and Lands in 1912.

FISCHER, fish'ēr, BERNHARD (1852-). A German bacteriologist, born in Coburg and educated at Berlin. He became M.D. in 1875, accompanied the German Cholera Commission to Egypt and India, in 1889 was a member of the German Plankton Expedition, and in 1887 became docent and in 1899 professor in the University of Kiel, where he was also director of the Institute of Hygiene. He made important bacteriological studies of sea water and sea air; also an original and valuable classification of bacteria, based on morphological characters, particularly number and distribution of cilia; and his *Structure and Functions of Bacteria* (2d ed., 1900) is a standard work.

FISCHER, EMIL (1838-1914). A famous German dramatic basso, born in Brunswick. He made his début in 1857 in Graz in Boieldieu's *Jean de Paris*. After that he filled various engagements in Pressburg, Stettin, and Brunswick. From 1863-70 he was director of the opera at Danzig. From 1875-80 he sang in Rotterdam, and from 1880-85 in Dresden. The period from 1885 to 1891 at the Metropolitan Opera House, New York, marks the culmination of his artistic triumphs. Here he not only created the bass rôles in Wagner's later music dramas, as far as America is concerned, but also firmly established his reputation as a Wagner interpreter surpassed by none and equaled by very few. Especially his Hans Sachs is still regarded as an ideal not reached by any other artist. From 1895 to 1897 he was a member of Mr. Damrosch's German company, and he appeared once more, and for the last time, at the Metropolitan Opera House in 1904. He died in Hamburg.

FISCHER, EMIL (1852-). A celebrated German chemist, born at Euskirchen. He studied at Strassburg and in 1879 was made professor extraordinary at the University of Munich. Three years later he was appointed full professor of chemistry at Erlangen and in 1885 was invited to take a similar position at Würzburg. When, on the death of the celebrated A. W. Hofmann, the chair of organic chemistry at the University of Berlin became vacant, Fischer was appointed to fill the vacancy (1892). His most important achievement was the synthetic production of the simple sugars and the complete demonstration of their chemical constitution.

Although he did not succeed in synthesizing ordinary cane sugar and the more complex carbohydrates (such as cellulose and starch), his researches have thrown much light on their chemical constitution and have thus paved the way for future success. Of very great importance, further, were his researches on the constitution of substances of the "purine group" (including the well-known alkaloids caffeine and theobromine), the polypeptides (artificial proteid-like substances), and the depsides (tannin-like substances). His epoch-making researches, which have created several new chapters in the science of organic chemistry, were crowned with the Nobel prize in 1902. His *Anleitung zur Darstellung organischer Präparate* (5th ed., 1896; Eng. trans. by Stanford, 1909) is well known to every student of organic chemistry. His papers have also been published in collected form. His publications include further *Die Chemie der Kohlenhydrate und ihre Bedeutung für die Physiologie* (1894) and *Chemical Research in its Bearings on National Welfare* (1912). See CARBOHYDRATES; POLYPEPTIDES; STEREOCHEMISTRY.

FISCHER, GUSTAV ADOLF (1848-86). A German explorer, born at Barmen. In 1876 he accompanied the Denhardt East African exploring expedition to Zanzibar, where he settled as a physician, and in the following year explored Wito and the southern Galla country. In 1878 he continued his journey to Wapokomoland and along the Tana River to Massa. With the support of the Geographical Society of Hamburg he visited the Massai country in 1882 and penetrated from the mouth of the Pagani to Lake Naivasha. The hostile attitude of the natives prevented him from advancing farther. Equipped with funds by the brother of Junker, an explorer, who with Emin Pasha and Casati had been lost in the equatorial provinces, he organized a relief expedition, which, however, was compelled to return after reaching Lake Victoria Nyanza. Shortly after his arrival in Germany in 1886, he died of a bilious fever contracted during this journey. He wrote: *Mehr Licht im dunkeln Weltteil* (1885), *Das Masai-Land* (1885), as well as articles in *Zeitschrift für Ethnologie* and in the *Verhandlungen* of the Hamburg Geographical Society.

FISCHER, JEAN CHRÉTIEN (c.1716-62). A German soldier in the French service, born in Stuttgart and educated at Giessen. He entered the French army about 1737 and fought in the War of the Austrian Succession. In 1743 he was authorized by the Marshal de Belle-Isle to raise a company, which was called Fischer's *chasseurs*, the origin of that branch in the French army. He was a prisoner from 1746 to 1748. He served in India and distinguished himself in the Seven Years' War, was made brigadier for his bravery at Arloff (1759), added to his fame at Clostercamp (1760), resigned his command to the Marquis de Conflans (1760), but still fought in his old troop with the rank of a lieutenant colonel. He was killed in a duel with a French officer who challenged him after the French defeat at Wilhelmsthal (June 24, 1762).

FISCHER, JOHANN GEORG (1816-97). A German poet, born at Gross-Süssen, Württemberg. He taught at Langenau, Ulm, and Stuttgart, and in 1860 was appointed professor at the scientific high school in the latter city. As a poet, Fischer may be regarded as the last note-

worthy representative of the traditional Suabian school. He was not in sympathy with modern naturalism and was influenced by Schiller, Goethe, Hölderlin, and especially Mörike. He was in the fullest sense a poet of Nature, whose every mood he portrays in his verses. Scarcely less meritorious are his love poems, of which he composed a great number, and which also are animated by an enthusiastic personification and idealization of Nature. Fischer has been called by his admirers "Der schwäbische Frauenlob." Among his principal productions are the following: *Gedichte* (3d ed., 1883); *Aus frischer Luft* (2d ed., 1873); *Neue Gedichte* (1891); *Saul*, a drama (1862); *Friedrich der Zweite von Hohenstaufen*, a drama (1863); *Florian Geyer, der Volksheld im deutschen Bauernkrieg* (1866); *Kaiser Maximilian von Mexiko*, a drama (1868).

FISCHER, JOSEF (1858-). A German historian and geographer, born in Quadrath, near Cologne. He studied at Münster, Munich, Vienna, and Innsbruck; in 1881 became a Jesuit; then studied at Dittion, in England, and, taking up history and geography, in Vienna and Innsbruck; and in 1895 began teaching geography at the Jesuit "Stella Matutina" in Feldkirch. In 1893-98 he wrote several volumes on Austrian history, but his more important, later work was on the early cartography and exploration of America. The titles of his principal works are: *Die Entdeckungen der Normannen in Amerika* (1902; Eng. trans. by Soulsby, *Discoveries of the Norsemen in America*, 1903); *Die älteste Karte mit dem Namen Amerika* (1903); *Waldseemüller's Cosmographie Introductio* (1907, with Von Wieser), including an English version of Vespucci's *Voyages*; *Die Weltkarte des Jodocus Hondius* (1907, with Luther Stevenson); *Der deutsche Ptolemäus* (1910); *Claud. Clavius, the First Cartographer of America* (1911); *Die handschriftliche Ueberlieferung der Ptolemäuskarten* (1912); *An Important Ptolemy Manuscript* (1913).

FISCHER, KUNO (1824-1907). A noted German philosopher and literary critic. He was born at Sandewalde, Silesia, studied at the universities of Leipzig and Halle, in 1850 became an instructor in philosophy at Heidelberg, and when his lectureship had been withdrawn in 1853 by direction of the Baden ministry, continued researches at Heidelberg and was in 1856 appointed a lecturer at Berlin. He had, however, a short time previously accepted an honorary professorship at Jena and continued to occupy it until 1872, when he was called to the chair of philosophy (to succeed Zeller) and modern German literature at Heidelberg. He achieved high distinction as academic lecturer, orator, and author. His philosophical viewpoint is, with some modifications, Hegelian. His chief work is the *Geschichte der neuern Philosophie* (jubilee edition in 10 vols., 1897-1903), at once the most extensive and the most distinguished exposition of the subject. In 1860 his *Kants Leben und die Grundlagen seiner Lehre* lent the first real impulse to the so-called "return to Kant." His controversy with Trendelenburg is noteworthy. Important among his further publications are: *Schiller-Schriften* (2d ed., 1891-92); *Lessings Nathan der Weise* (1896); *Baruch Spinozas Leben und Charakter* (1865); *Goethe-Schriften* (8 vols., 1895-1900); *Shakespeare's Hamlet* (1896); and several "Festreden," such as *Goethe in Heidelberg* (1899).

FISCHER, LUDWIG HANS (1848-). An

Austrian landscape painter and etcher, born at Salzburg. A pupil, at the Vienna Academy, of Lichtenfels in painting, of Jacoby in engraving, and of Unger in etching, he completed his studies by travels in Italy, Spain, north Africa, Egypt, and India, and afterward settled in Vienna. Three of his oil paintings, including a "View of Jerusalem," are in the Vienna Museum, and nine decorative landscapes are in the Museum of Natural History there. Among a series of etchings and engravings the cycle "Historical Landscapes from Austria-Hungary" is his most remarkable production. He also painted many excellent water colors and published *Die Technik der Aquarellmalerei* (8th ed., 1901), and wrote numerous magazine articles accompanied by clearly defined and spirited drawings.

FISCHER, fêshâ', PAUL HENRI (1835-93). A French paleontologist and naturalist, born in Paris. Having obtained his doctorate in sciences and in medicine, he was appointed assistant in paleontology at the Museum of Natural History. In 1872 he became assistant naturalist at the same institution. He was at different times president of the Société Géologique de France and the Société Zoologique de France and in 1880 was a member of the commission for submarine dredging. From 1856 he edited, with Bernardi, the *Journal de conchyliologie*. His publications include: *Fauna conchyliologique marine de la Gironde et du sud-ouest de la France* (1865; enlarged by a *Supplément* in 1875); *Recherches sur les Actinies des côtes océaniques de France* (1876); a *Manuel de conchyliologie* (1885); *Paléontologie de l'île de Rhodes* (1887).

FISCHER, fish'êr, THEOBALD (1846-1910). A German geographer, born Oct. 31, 1846, at Kirchsteitz, near Leitz, in Thuringia, and educated at Heidelberg, Halle, Bonn, and Vienna. In 1871 he went to Brussels as a private tutor and eventually to Paris. He was professor of geography at Kiel from 1879 to 1883, when he took the same chair at Marburg, holding it until his death. He was a specialist on Mediterranean geography. In 1886 he visited the Tunisian Sahara and in 1888 made a tour through Morocco and Algeria. In addition to numerous contributions to scientific periodicals his publications include: *Raccolta dei mappemondi e carte nautiche del XIII al XVI secolo* (10 atlases, containing 79 leaves, 1881); *Beiträge zur Geschichte der Erdkunde und der Kartographie in Italien im Mittelalter* (1886); "Die südeuropäischen Halbinseln," in Kirchhoff's *Allgemeine Länderkunde*, is considered his masterpiece. The section dealing with Italy was translated under the title of *La Penisola Italiana*.

FISCHER VON ERLACH, fish'êr fôn êr'-lâç, JOHANN BERNHARD (1650-1723). An Austrian architect, born in Vienna. Returning to Vienna after a period of study in Rome, he was employed on the most important buildings of the late seventeenth and early eighteenth centuries in that city. Among the most notable of his works, all of which were designed in the extremest phase of the Baroque (q.v.) style, were the palace of Schönbrunn, the Hofbibliothek (Royal Library), the palace of Prince Eugène, and the church of San Carlo Borromeo; besides works in Breslau and Prague. His son, Joseph Emanuel, completed the library and church above mentioned after his death.

FISCHER VON WALDHEIM, vîlt'hîm, GOTTHELF (1771-1853). A Russian physician

and naturalist, born at Waldheim, Saxony. After holding a professorship at Mainz, he accepted a call to Moscow (1803), where he became professor of natural history and director of the university museum devoted to that branch of science. In 1808 he founded the Society of Naturalists at Moscow. He published numerous works on comparative anatomy, on the nutrition of plants, and on galvanism. One of the most important of these is the *Bibliographia Palæontologica Animalium Systematica* (2d ed., 1834).

FISCUS. See **ÆRARIUM**.

FISET, fêzê', LOUIS JOSEPH CYPRIEN (1825-). A Canadian poet. He was born in Quebec, was educated privately and at Quebec Seminary, and was called to the bar in 1848. He was soon afterward appointed a prothonotary of the Superior Court of the Province of Quebec, an office which he held for many years. In 1860, when the Prince of Wales (afterward Edward VII) arrived at Quebec, the ode of welcome to him was written by Fiset. In 1867 his poem on the discovery of America won a prize in a poetical competition at Laval University. He was a frequent contributor to *La Ruche Littéraire* (Montreal), to *Les Soirées Canadiennes*, and to *La Littéraire Canadienne* (Quebec). He was one of the founders of L'Institut Canadien (Quebec), and afterward became its president. He retired on a pension in 1898. He published *Jude et Gracia, ou les malheurs de l'émigration canadienne* (1861).

FISET, MARIE JOSEPH EUGENE (1874-). A Canadian soldier. He was born at Rimouski, Province of Quebec, and was educated at Rimouski College and at Laval University, where he graduated in medicine in 1896. He had entered the volunteer militia service as a lieutenant in 1890, was promoted major in 1893, and was brevetted lieutenant colonel in 1901 for his services in the South African War; in 1900 he had been at Paardeberg, Poplar Grove, Driefontein, Hout Nek, and Zand River; also in Orange River Colony and eastern and western Transvaal. In 1903 he was promoted lieutenant colonel, army medical service, and also staff adjutant of medical services; in 1903-06 he was director of general medical services; and he was then appointed Deputy Minister of Militia and Defense. He received the Queen's medal with four clasps, and the decoration of the Distinguished Service Order.

FISH (AS. *fisc*, Ger. *Fisch*; connected with Lat. *piscis*, OIr. *iasc*, fish). A backboneed animal which lives in water, breathes by means of gills, and possesses paired fins. Such animals constitute the class Pisces, but popularly the term "fish" includes, in addition to the above, certain other lower vertebrates, the lancelets (Leptocardii) and the round-mouths (Cyclostomata), not to mention the ignorant error of speaking of whales, etc., as "fish."

Form. It is almost impossible to describe the form of a fish in terms that would include all the different varieties, notwithstanding the fact that the group as a whole presents a greater uniformity of form than other vertebrate groups, e.g., birds. The majority, however, have a more or less elongated body, tapering at both ends. The variations in form can usually be correlated with the habits of the fish. The great variety of habitats into which the fish have been crowded, and to which they have become adapted, has resulted in great diversity of form, though this diversity is mostly concerned with detail, leav-

ing, as stated above, a characteristic fish form as a whole. The typical symmetry of a fish is embodied in such forms as the trout.

FORMS OF SCALES.

1, 2, cycloid scales; 3, 4, 5, 6, ctenoid scales; 7, ganoid scales; 8, 9, dermal papillae (from *Monacanthus*); 10, 11, cycloid scales from lateral line.

Integument. Fishes are usually covered by scales or bony plates. These may become very minute, as in eels, or may be entirely wanting, as in the leather carp, in certain eels, and in many of the catfishes. Scales may be either bony or horny and are generally imbricated like slates on a roof, the free end being backward. They arise from the deeper layer of the skin, the derma, grow outward and backward, and remain covered by a thin layer of epidermis. Bony plates are attached by the whole of one surface and usually have a coat of enamel, which is

derived from the epidermis, while the bony base arises from the derma. The differences of character in the scales have been made the basis of a classification of fishes by Louis Agassiz, according to whom all fishes are distributed into four orders, Cycloidei, Ctenoidei, Placoidi, and Ganoidei. This classification was very artificial and did not admit many intermediate cases, or the cases where more than one kind of scale was

OPEN MOUTH OF A SALMON.

Shows arrangement of maxillary, palatine, and vomerine teeth in fishes.

possessed by the same fish, and has long been disused, but it has been found very convenient in the study of fossil fishes. Here also it is giving way to a more natural classification. The dermal plates may become variously specialized, giving rise to spines, teeth, etc. The teeth vary greatly in size, shape, and arrangement. They may be

flat, platelike, as in the rays, or long and sharp, as in certain sharks. The conditions in the sharks and in certain other groups show in the clearest way, by their structure and transitional forms, that they are merely modified dermal plates or denticles. In the more recent fishes they are not restricted to the edge of the mouth, but may occur in the roof and floor, and on the tongue, gill bars, and pharynx. The epidermis of fishes contains unicellular glands, which secrete the mucus covering their body, and pigment cells giving rise to the colors of the body.

Skeleton. The skeleton of fishes consists of the skull with its visceral skeleton, the vertebral axis with its processes, the pelvic and pectoral girdles, and the supporting elements of the various fins. This in the lower cartilaginous fishes consists only of cartilage, no true bones being present. The skull, which in the higher fishes is a complicated structure, in the elasmobranchs consists of a rather simple cartilaginous hollow case, the chondrocranium, inclosing the brain, and not composed of distinct pieces. As one ascends the scale, bones are added to this chondrocranium from the outside, arising as dermal ossifications; these are probably merely highly modified dermal plates. In the ganoids the chondrocranium generally persists with centres of ossification present, and the whole head is incased in dermal bones. In the higher bony fishes the chondrocranium is usually replaced by cartilage bones with many dermal bones added. To the lower part of the skull in all fishes a series of arches are attached. These form the lower jaw and the hyoid and gill arches. The backbone generally consists of a series of vertebrae which, with the exception of *Lepidosteus*, are biconcave. Dorsally they bear neural arches inclosing the spinal cord, and these are prolonged dorsally as a neural spine, varying in length.

VERTEBRA OF A BONY FISH.

Front and side views. *c*, centrum; *na*, neuropophysis; *pa*, parapophysis; *ha*, hæmapophysis; *ns*, neural spine; *hs*, hæmal spine; *za*, zygapophysis.

Ventrally the vertebrae bear ribs in the anterior portion, and in the caudal region there are hæmal arches inclosing the caudal artery and vein. These arches are prolonged ventrally as a hæmal spine. In some elasmobranchs, in the chimæras, in the lungfishes, and in some ganoids, there are no such definite vertebrae developed, but the notochord, which in the teleosts persists only as remains in the cavities between the ad-

joining centra, is a continuous rod. The neural and hæmal arches and the ribs are variously developed. In most of the elasmobranchs there are present definite biconcave vertebræ with neural and hæmal arches, transverse processes,

VERTEBRÆ OF A CARTILAGINOUS FISH.

a, centrum; b, neurapophysis; c, intercostal cartilage; d, hæmapophysis; e, spinal canal; f, intervertebral cavity; g, central canal of persistent portion of notochord; h, hæmal canals for blood vessels.

and rudimentary ribs, but they remain cartilaginous or become only slightly ossified. The centra are pierced by a canal through which remains of the notochord are continuous. The posterior end of the spinal column forms the basis of the caudal fin. See SKELETON.

The fins are supported by cartilaginous or bony rods. In the dorsal and anal these rods do not join those of the internal skeleton directly, but, embedded in the flesh, are interposed between the spinous processes of the vertebræ. The paired fins, not always all present, represent the typical fore and hind limbs of quadrupeds. They consist of a basal set of bones, varying in number and arrangement in the different groups, bearing the radiating fin rays, and articulating proximally with the pelvic or shoulder girdle. The girdles are cartilaginous in elasmobranchs, lungfishes, and sturgeons; but in teleosts this, like the chondrocranium, has additions in the way of dermal bones, which have become associated with it. The pelvic bones may be embedded in the muscles of the abdomen, or may occur farther anterior and become fastened to the pectoral girdle. In some fishes the pelvic fins, which answer to the hind feet of quadrupeds, are actually farther forward than the pectoral fins and are then called jugular. In some fishes, as in the common eel, the ventral fins are wanting, while in others both pairs may be absent. In lungfishes "the skeleton of the pectoral fin consists of a stout basal cartilage, an elongated, tapering central axis made up of a number of short cartilaginous segments, and two rows of jointed cartilaginous rays extending out on either side of the axis." See FIN.

Internal Structure. The *respiratory organs* of fishes consist of gills and, in the case of Dipnoi, of gills and lungs. In the region of the pharynx the alimentary canal communicates with the exterior on each side by a series of slits called gill clefts. The water passing through the mouth into the pharynx escapes to the exterior through these gill clefts. The bars bounding these clefts have attached to them the gills, which are merely the mucous membrane of the bars raised up into a number of ridges, called branchial filaments. These are highly vascular, the blood entering them being venous in character, and they constitute the true respiratory organs. The water passing through the clefts bathes the filaments and effects the necessary interchange of gases. In the lungfishes the air bladder has assumed the function of a lung.

This organ is not a smooth-walled bag, as in other fishes, but a highly vascular, much-chambered organ. The air enters it through a connection with the pharynx. See GILL; RESPIRATORY SYSTEM.

The *air*, or *swimming bladder* of fishes is a sac, usually unpaired, filled with gas and lying dorsal to the intestine. Embryologically it corresponds with the lungs, as it arises as a diverticulum of the intestine, and in this connection may persist as the pneumatic duct, or in other cases may be wholly lost. The function of the air bladder is not always clear. When it is supplied with venous blood, as in Dipnoi and Amia, and its gases are periodically exchanged for outside air, it doubtless functions as a lung. When it is supplied with arterial blood or when it is a closed sac, its function is supposed to be hydrostatic. It may, in addition, serve as a storehouse for oxygen taken in by the gills. The contraction and expansion both of the bladder and of the body musculature serve to condense and expand the air in the bladder and thus may aid the fish in rising or sinking in the water. Unequal anterior, posterior, or lateral pressure on the bladder may likewise aid the fish in directing its course. In some fishes the forked anterior end of the air bladder fits closely against the posterior wall of the auditory capsule. In carps and siluroids the bladder and auditory organs are connected by a chain of bones. Such connections doubtless enable the fish to become more keenly sensitive to any change in hydrostatic pressure in the bladder.

Except in teleosts, where a *conus arteriosus* is wanting, the heart of fishes consists of (1) a sinus venosus, (2) one auricle, (3) one ventricle, and (4) a *conus arteriosus*. In the teleosts the *conus* is represented by the *bulbus arteriosus*, which, however, is a part of the aorta and does not undergo rhythmical contraction like the *conus*. The sinus venosus is a thin-walled expansion of the afferent veins, and a sort of antechamber to the thin-walled auricle. From the latter the blood passes into the thick-walled, muscular ventricle, thence either into the ventral aorta (teleosts) or into the *conus*. From the *conus* the ventral aorta extends forward a short distance and then divides on each side into a number of branches (afferent branchial arteries), which pass through the gill arches, breaking up there into capillaries in the gill filaments, which recollect into the efferent branchial arteries. These unite above the pharynx as a single large artery, the dorsal aorta, which passes backward through the entire length of the body, supplying the different organs. The most important branches given off are the carotids to the head, the subclavian to the pectoral fins, the mesenteric and celiac to the digestive organs, the renal to the kidneys, the spermatic or ovarian to the reproductive glands, and the iliac to the pelvic fins. Posteriorly the aorta is continued as the caudal artery. From the anterior part the blood is returned by the jugular vein; from the pectoral fin by the subclavian; from the digestive system by the hepatic portal to the liver; thence by the hepatic; and from the other portions of the body by the cardinal. All these enter the sinus venosus. Thus, in all except the lungfishes the heart contains only venous blood. All the blood on its course to the system passes through the gills first and is there purified. In the lungfishes, where the air bladder functions as a lung, some arterial blood

reaches the heart from the air bladder by the pulmonary vein. This empties into the left side of the sinus venosus. The sinus venosus, the auricle, and the conus are imperfectly divided in the lungfishes, suggesting the condition in amphibia. The blood corpuscles of fishes are nucleated.

The *central nervous system* in fishes consists, as in other vertebrates, of a brain and spinal cord and the sympathetic system. The brain presents the usual divisions of the higher forms. It lies in the same plane with the spinal cord and exhibits no flexures. The brain does not completely fill the cranial cavity, and the intervening space is filled with the gelatinous arachnoid tissue. In the teleosts the optic lobes and the cerebellum constitute the largest divisions, the cerebrum remaining very poorly developed. In the elasmobranchs the olfactory lobes may be enormously developed. Ten cranial and many spinal nerves leave the brain and spinal cord. The sympathetic system presents the usual character and relations found in vertebrates. The emotions of fishes (manifestations of anger, fear, etc.), indicative of the mental status, are extensively considered in the *Proceedings* of the Zoölogical Society of London for 1878.

Sense Organs. Unequally scattered over the body of fishes there are the so-called "end buds," modifications of the epidermis. In structure these sense organs largely resemble taste buds, which in the vertebrates above fishes are restricted to the mouth cavity. In fishes these end buds are probably also taste organs, since it has been shown that a fish can taste with its skin. Besides these there are other aggregations of sense cells, probably tactile in function. Situated within longitudinal grooves or pits are sense cells, probably largely tactile in function, known as the lateral-line organs. These grooves open by definite pores to the surface. There is usually one series of such along each side, known as the "lateral line," but there may also be developed a more or less complicated system of grooves on the head. Many fishes have filamentous appendages, more or less definitely arranged around the mouth and nose, known as barbels. Cave-dwelling fishes, which have lost their power of sight, have strongly developed tactile papillæ on the head. The organs of smell are a pair of pits in the skin at the anterior dorsum of the head, lined with sense cells. There are no internal nares except in the Dipnoi, but the pits open to the surface by the external nares, each more or less completely divided into two, to permit the water to enter one, bathe the sense surface, and escape by the other. Fishes have no external and middle ear, but merely the inner, consisting of the semicircular canals, with their ampullæ, a sacculus, and utriculus. The otoliths are large. Various experiments point to the conclusion that the ear in fishes is merely an organ of equilibrium. The eyes have the usual structure of the vertebrate eye. The accessory organs, like the lids and lachrymal glands, are poorly developed. Eyes may be absent in cave and deep-sea forms. See NERVOUS SYSTEM, EVOLUTION OF.

The *digestive system* consists, as in other vertebrates, of the alimentary canal, with its more or less definitely marked divisions (mouth, pharynx, gullet, stomach, and intestine), and its glands, liver, gall bladder, and the pancreas. The mouth and its teeth present the greatest

variety in form and arrangement. The pharynx opens to the surface by the gill clefts as above indicated. The gullet and stomach vary with the food habits of the fish. Predatory fishes swallow and stow away large objects. An extreme instance is the deep-sea fish *Chiasmodon niger*, which has been taken with a fish in its distensible stomach larger than itself. At the junction of the stomach and intestine, in ganoids and in nearly all teleosts, are given off a number of blind sacs, the pyloric cæca. These may be very numerous. The intestine in all fishes except teleosts has a spiral valve in the form of a ridge running spirally along the wall and projecting into the interior of the intestine. The alimentary canal opens either with the urinogenital ducts into a common chamber, the cloaca, or, as in teleosts, ganoids, and Dipnoi, separately to the exterior. There are no salivary glands. See ALIMENTARY SYSTEM, EVOLUTION OF.

The *excretory organs* in all fishes are a pair of glands situated just under the backbone and protruding into the body cavity. The excretion is carried away by a ureter, which empties variously in the different groups of fishes. In the elasmobranchs and Dipnoi the kidneys extend for about two-thirds the length of the body cavity, and the ureters, having united, open into the cloaca as a common duct. In the teleosts and ganoids the glands may occupy the entire length of the body cavity. The ureters open into a urinary bladder, and this into the urinogenital sinus, the latter opening separately to the exterior. See EXCRETORY SYSTEM, COMPARATIVE ANATOMY OF.

Reproduction. The sexes are separate. The testes and ovaries are paired organs varying in shape and position in the abdominal cavity with the different groups. The products of the male and those of the female may or may not be led to the exterior by a duct. In the male this may be a more or less convoluted vas deferens or a simple continuation of a bag. In teleosts the testes or ovaries are simply continued posteriorly as a duct which empties into the urinogenital sinus. In case there is no oviduct the eggs break free into the body cavity and pass into the urinogenital sinus by a pair of slits in the anterior wall. In ganoids there is always an oviduct. In the elasmobranchs and Holocephali there is an oviduct, usually quite highly developed, opening into the cloaca. In many teleosts and in nearly all elasmobranchs and Holocephali the eggs are fertilized in the body of the mother. In many instances the egg develops there to quite an advanced stage. In all other fishes the milt is poured over the eggs as they are extruded, or into the water in the immediate vicinity. In elasmobranchs and Holocephali the "claspers" act as intromittent organs, by which the milt is introduced into the body of the female. In the ovoviviparous teleosts the anterior portion of the anal fin is modified into an intromittent organ.

Breeding Habits. Fishes that lay eggs show no parental care, as a rule, either for their eggs or young. The eggs are fastened to rocks or weeds or other objects, and the eggs and young are left to shift for themselves. In many marine species the eggs are extruded into the water, and during their first period of development float at the surface and are carried about by the currents. In all such cases the loss both of eggs and young must be very great, and to meet this

loss such species usually produce enormous numbers of eggs. Thus, a single large cod may produce in a single year 10,000,000 eggs. On the other hand, in some species there is considerable care bestowed upon the eggs and young by the parents—this duty usually falling to the male. The sticklebacks (q.v.) are well-known instances. The male builds a nest of sticks, grass, etc., cementing them together with a sticky excretion, and guards the nest and eggs during incubation. In some of the Siluridae, after the young are ready to leave the nest, the male may be seen leading the brood about, guarding it until the individuals are better able to shift for themselves. This instinct is found in other families. The cave blindfish (*Amblyopsis*) retains the eggs during incubation in its capacious gill cavity. The sea horse develops a brood pouch along the ventral side of the body, in which the eggs and young are harbored. Many marine fishes, like the shad and the salmon, ascend the rivers each season to spawn. These migrations may be for great distances and against the greatest difficulties, such as rapids and falls. Such migratory species are known as anadromous fishes. The reverse process takes place in the case of the eel, which goes to the ocean to spawn.

The spawning season of most species is during the spring months. In the tropics, where the rainy and dry seasons alternate, these are determining factors in the time of spawning of certain species. Many species spawn during the colder months, e.g., the Salmonidae. Many fishes show on the approach of the breeding season a noticeable sexual difference, the male being marked by more brilliant colors, or by the temporary growth of tubercles on the head and other portions of the body. Many species, however, do not exhibit this sexual dimorphism.

The eggs of fishes vary greatly in size and shape. The typical fish egg is globular, more or less transparent, having a tough protective membrane, within which the yolk-laden egg proper lies. The yolk is present in sufficient amount to maintain the embryo until it can swim about and feed for itself. The outer protective membrane is very commonly sticky, to enable it to cling to stones, weeds, etc. Sometimes eggs stick together in clusters. In other cases the outer coat has tufts of fine filaments with which the egg fastens itself to weeds. The shark's eggs are inclosed in large, horny, purse-shaped cases within which the embryo is developed. The period of incubation is very various. In certain pelagic eggs the embryo emerges from the eggs in 24 to 48 hours after deposit, while in other cases, as the trout, the period extends over three to six months. See Egg; EMBRYOLOGY.

Food. The food of fishes includes all sorts of vegetable and animal matter and forms. Some are omnivorous. Others are exceedingly choice about their food, living almost exclusively upon certain species of crustacea, for instance. Some, like the carp, are vegetarians, and the smaller fishes are the principal food of the larger, predacious forms, like the trout and bluefish. Many species subsist entirely upon the minute organisms they can strain out of the water.

Distribution in Space and Time. About 13,000 species of living fishes are known. In their distribution fishes are almost coextensive with water. The greatest variety is found in the tropics. Many families are exclusively marine, others as exclusively of the fresh water,

while many have representatives in both, or spend a portion of their time in each. Certain groups, like the Cyprinodontinae, are distributed only along the shallow shore waters; others, like the sharks and bluefish, are pelagic, living on the high seas, and such usually have a wide distribution. The ocean depths have their peculiar fish fauna—species modified for these peculiar conditions and unable to subsist at the surface. These species, living in darkness, often have no eyes, and many are phosphorescent. The coldest latitudes harbor their fishes. Some families, like the cod, are prevailingly distributed in colder waters, and certain species have been taken in lakes above the line of perpetual snow. Temperature is one of the important factors in determining the distribution of fishes. Deep-sea forms, where the temperature is uniform, have a wide distribution. The geological history of any region, with the changes in the river systems, etc., it has brought about, is another important factor. See DEEP-SEA EXPLORATION; DISTRIBUTION OF ANIMALS; CAVE ANIMALS; EVOLUTION.

Ancestry. The medium in which fishes live and the hard and almost indestructible nature of some portions of their skeleton, as their teeth, spines, and scales, would lead us to anticipate their frequent occurrence in the sedimentary rocks; but inasmuch as the soft parts of the animal are liable to speedy decomposition, the remains of fish must often exist in a fragmentary and scattered condition. Thus, the teeth in the shark, the spine defense in the sting ray, and the scales in the bony pike would survive the total destruction of the cartilaginous skeleton as well as the soft portions. Many quite complete casts of skeletons, however, have been obtained, so that not a little is known of the past history of the group. The earliest fishes occurred in the Upper Silurian. Remains of all of the main groups, excepting the higher teleosts, have been found from this period. Among the elasmobranchs the earlier forms were quite distinct from any now living, with the possible exception of the Port Jackson shark (q.v.). These forms flourished to the Triassic period, and in the case of the cestracionts to the Eocene. The recent elasmobranchs appeared in the late Triassic or early Jurassic, and were more abundant in the past than at present. The Dipnoi flourished in the Triassic. The ganoids were a dominant group up to Miocene times, but at present exist in mere remnants. The dominant fishes of to-day, viz., the higher teleosts, first appeared in numbers during the Jurassic and Cretaceous periods. These at the present day exhibit the greatest diversity in type. In times past the other groups presented this great variety of form, and it is mainly those species that retained the more generalized characters that survived and are present with us now. See EXTINCTION OF SPECIES.

Economic Value. By far the most important use of fishes to man is in supplying him with food, and in some regions they form the principal means of subsistence. Some fishes, nevertheless, are unpalatable, and even poisonous to a greater or smaller extent. The skin of some cartilaginous fishes yields shagreen, and the air bladder of some species yields isinglass. The minute laminae which give brilliancy of color to some, and the similar substance found in the air bladder of others, afford the materials of which artificial pearls are made. Oil useful for

lamps, etc., is obtained from several species, and the medicinal value of cod-liver oil is now well known. See FISHERIES.

Classification. *History of Ichthyology.*—Among the ancient students of ichthyology, that branch of natural history which treats of fishes, the first to be mentioned, as usual, is Aristotle. In modern times ichthyology began to be cultivated about the middle of the sixteenth century by Belon, Rondelet, and Salviani. Their work was of value locally only. The first work of real value, and which marks the beginning of a system based on scientific principles, was that of Willughby and Ray, which appeared in 1686 under the title *Historia Piscium*. Here a distinct effort at classification was made. They divided all fishes into two classes, Cartilaginei and Ossei. Each of these classes was divided into two groups, on the basis of the form of the body—the Cartilaginei into Longi, including the sharks, and Latii, including the skates; and the Ossei into Plani, including the flatfishes, and non-Plani, including all others. It is at once evident how artificial this classification is. Artedi, whose writings, on account of his death, were published by Linnæus, worked out a system of classification considerably influenced by Willughby and Ray. He included the cetaceans among the fishes. His system was adopted by Linnæus in his earlier editions of *Systema Naturæ*, but later (1758) Linnæus devised an original classification, which, among other changes, eliminated the Cetacea from the fishes and placed them with the mammals. The classification worked out by Bloch and Schneider was superficial in the extreme. The number of fins present was the basis of their division into Monopterygia, Dipterygia, etc. This work was published in 1801. Bloch, in 1782–95, published a large and important work on fishes, comprising nine volumes with fine illustrated plates, in which he described about 400 species. Several other authors wrote extensively on fishes during the last half of the eighteenth century and the beginning of the nineteenth. Among these is to be mentioned Lacépède, *Histoire naturelle des poissons* (5 vols., Paris, 1803), in which 1400 species were described. During the first quarter of the nineteenth century Cuvier did much on the classification of fishes, his system appearing in his *Règne Animal* (Bonn, 1830). The anatomist Johannes Müller published in 1846 a natural classification which influenced the systems to a very high degree. He divided fishes into Leptocardii, Marsipobranchii, Elasmobranchii, Ganoidea, Teleostei, and Dipnoi. Louis Agassiz (q.v.) advanced our knowledge both of living and fossil fishes. Influenced by the latter, he divided the class into four groups on the character of their scales: placoid, ganoid, cycloid, and ctenoid. This classification, though convenient in many ways for the study of fossil remains, was adopted by scarcely any of the authorities. Albert Günther, in his *Catalogue of Fishes in . . . the British Museum* (London, 1859–70), has largely modeled the modern system of classification. Among the more recent influential American ichthyologists are Theodore Gill, the late E. D. Cope, and David Starr Jordan, whose historical review of ichthyology in the *Proceedings of the American Association for the Advancement of Science* for 1902 is very complete.

Present Arrangement. The subphylum Vertebrata includes as the lowest in rank of its

groups several series of fishlike vertebrates, divisible first into Acraniata (the lancelets [*Lepetocardii*] only; see AMPHIOXUS), and Craniata, which includes all the remainder. The fishlike Craniata fall into two classes:

I. CYCLOSTOMATA. Characterized chiefly by having “a suctorial mouth devoid of functional jaws” and by the absence of paired fins; these are the lampreys and hagfishes (orders Petromyzontes and Myxinoidei).

II. PISCES. Characterized by having the organs of respiration (gills) and the organs of locomotion (paired fins) adapted for an aquatic life. The class is divided into subclasses, as follows:

1. *Elasmobranchii*.—Pisces with a skeleton composed essentially of cartilage—the sharks, rays, etc., divided into three orders, Cladosealachea, Pleuracanthæa, Acanthodea, and Selachii. The first three are represented by Paleozoic fossil forms. The last includes many extinct and all the existing forms.

2. *Holocephali*.—Sharklike Pisces, with a large compressed head and a single external branchial aperture. It includes only the family Chimeridae (chimeras).

3. *Teleostomi*.—Pisces “distinguished from the Elasmobranchii and Holocephali by having the primary skull and shoulder girdle complicated by the addition of membrane bones, and by possessing bony instead of hornlike fin rays.” This includes all of the common “bony fishes,” as well as the so-called ganoid fishes. Its orders are: Crossopterygii (bichir, etc.); Chondrostei (sturgeons); Holostei (garpikes, etc.); Teleostei (bony fishes generally). The first three orders are frequently grouped together as “Ganoidei.”

4. *Dipnoi*.—Pisces with lunglike respiratory organs as well as gills, and the fins constructed on the type of the archipterygium. It includes the lungfishes and by some authors is made a separate class altogether. Its orders are Monopneumona and Dipneumona.

5. *Ostracodermi* (q.v.).—A group of uncertain limits and affinities, known only from Paleozoic fossils, “characterized by the extraordinary development of the exoskeleton (bony plates) of the head, and the absence, in all the fossil remains hitherto found, of endoskeleton, including jaws.”

Bibliography. Bloch, *Allgemeine Naturgeschichte der Fische* (Berlin, 1782–95); Cuvier and Valenciennes, *Histoire naturelle des poissons* (22 vols., Paris, 1828–49); Günther, *Catalogue of Fishes in British Museum* (London, 1859–70); id., *Introduction to the Study of Fishes* (Edinburgh, 1880); Dean, *Fishes, Living and Fossil* (New York, 1895); Boulenger, “Fishes,” in *Cambridge Natural History*, vii (London, 1904); Jordan, *Fishes* (New York, 1907); Lydekker, Cunningham, Boulenger, and Thomson, *Reptiles, Amphibia, and Fishes* (London, 1912); Ward, *Marvels of Fish Life* (New York, 1912); Gregory, *The Orders of Teleostomous Fishes* (ib., 1907); Goodrich, *Fishes*, vol. ix of *Lankester's A Treatise on Zoology* (London, 1909); Murray, *The Depths of the Ocean* (ib., 1912). Consult also various works on the comparative anatomy of vertebrates, such as Huxley, Gegenbaur, Owen, Parker and Haswell, Wiedersheim, etc. Of faunal works the principal are: Jordan and Evermann, *Fishes of North and Middle America* (4 vols., Washing-

ton, 1896-1900); Goode and Bean, *Oceanic Ichthyology* (ib., 1895); Goode, *American Fishes* (New York, 1888); annual *Reports and Bulletins of the United States Commission of Fish and Fisheries and of the National Museum* (Washington, 1870 onward); governmental documents issued by Canada and Newfoundland; Eigenmann, *South American Fishes* (San Francisco, 1893); Yarrell, *History of British Fishes* (3d ed., London, 1859); Couch, *History of British Fishes* (ib., 1865); Houghton, *Fresh-water Fishes of Great Britain* (ib., 1879); Siebold, *Die Süßwasserfische von Mitteleuropa* (Leipzig, 1863); Blanchard, *Les poissons des eaux douces de la France* (Paris, 1866); Day, *Fauna of British India: Fishes* (London, 1889); Hutton and Hector, *Fishes of New Zealand* (Wellington, 1872). For fossil fishes, consult: Woodward, *Outlines of Vertebrate Paleontology* (Cambridge, 1898), in which is a full bibliography to the fossil forms; Agassiz, *Recherches sur les poissons fossiles*, vols. i-iii and supplement (Neuchâtel, 1833-44); Woodward, *Catalogue of Fossil Fishes of the British Museum*, vols. i-iii (London, 1889-95); and for American forms, Newberry, "Paleozoic Fishes of North America," in *Monographs of the United States Geological Survey*, vol. xvi (Washington, 1890).

FISH, HAMILTON (1808-93). An American statesman. He was born in New York City, graduated at Columbia College in 1827, studied law, and was admitted to the bar in 1830. In 1842 he was elected to Congress as a Whig. In 1846 he was the Whig nominee for Lieutenant Governor on the same ticket with John Young for Governor. During the campaign Fish antagonized the "antirenters" (see *ANTIRENTISM*), with the result that, although the Whig ticket was generally successful, he himself was defeated. In the year following, however, on the appointment of his successful Democratic competitor, Addison Gardiner, as a judge of the State Court of Appeals, a special election was held to fill the vacancy, at which Fish was elected. In 1848 he was nominated by the Whigs for Governor, and the result was a sweeping victory for Fish. In 1851 he was elected United States Senator to succeed Daniel S. Dickinson. The years 1857-60 he spent in Europe, returning in the latter year to take an active part in the campaign in behalf of the Lincoln ticket. During 1861-62 he was associated with other prominent citizens of New York on the Union Defense Committee, which cooperated with the municipal government in raising and equipping troops and in relieving New York volunteers and their families. Early in 1862 he was appointed, with Bishop Ames, a commissioner to proceed to Richmond and other Southern cities within the Confederate lines to relieve Federal prisoners; and although the Confederate authorities refused to allow them to proceed, the negotiations that followed resulted in an arrangement for the exchange of prisoners that was continued throughout the Civil War. In March, 1869, Fish was appointed Secretary of State and served through both of Grant's administrations, retiring in 1877. In 1871 he was one of the commissioners who negotiated and signed the Treaty of Washington with Great Britain. During the "Alabama Claims" arbitration he was successful in securing the adoption by the tribunal of a provision which relieved the United States from responsibility for indirect damages arising out of the Fenian raids and Cuban filibustering ex-

peditions. He also brought about the settlement of the long-standing Northwestern Boundary dispute with Great Britain, which resulted in the cession to the United States of the island of San Juan (see *SAN JUAN BOUNDARY DISPUTE*), and the satisfactory settlement of the complications growing out of the *Virginian* massacre (q.v.). Under his direction, also, extensive reforms were undertaken in the consular service, by which civil-service examinations were required of candidates.

FISH, HAMILTON, JR. (1849-). An American lawyer and politician, born in Albany, N. Y., the son of Hamilton Fish. He graduated at Columbia College in 1869, acted as private secretary to his father, and after his graduation at Columbia Law School (1873) was aid-de-camp to Governor John Adams Dix; he was Republican leader in the Assembly in 1890, and its Speaker in 1895. He was Assistant Treasurer of the United States in 1903-08 and a member of Congress in 1909-11.

FISH, NICHOLAS (1758-1833). An American Revolutionary soldier. He was born in New York City and began the academic course at Princeton, but left before graduating to pursue the study of law in the office of John Morin Scott in New York. There he became actively interested in the organization of the Sons of Liberty (q.v.) and in 1776 was appointed by Scott, who had been commissioned brigadier general, as aid-de-camp on his staff. At the close of the Revolutionary War he held the rank of lieutenant colonel. He was a division inspector under Steuben in 1778 and ably seconded that officer in his attempts to drill and discipline the continental troops. He participated in the battles of Saratoga and Monmouth, in Sullivan's expedition against the Indians in 1779, and in the Virginia and Yorktown campaigns, in which he served for a time on the staff of Lafayette. In 1786 he was appointed adjutant general of New York State, which position he held for many years. In 1794 he was appointed by Washington supervisor of the Federal revenue in New York City. In 1811 he was the Federalist candidate for Lieutenant Governor of the State, and carried New York City by a large majority. During the War of 1812 he served as a member of the City Committee of Defense.

FISH, NICHOLAS (1846-1902). An American diplomatist, grandson of Col. Nicholas Fish, and son of the Secretary of State, Hamilton Fish (q.v.). Born in New York and educated at Columbia and at Harvard Law School, he practiced law in New York City and then went into the diplomatic service. Appointed Second Secretary of Legation at Berlin (1871), he became Secretary (1874) and acted in the continued absence of his chief as chargé d'affaires, held the latter position in Switzerland (1877-81) and then served as Minister to Belgium (1882-86). He returned to New York in 1887 and became a member of the banking firm of Harriman & Co. He was president of the New York branch of the Society of the Cincinnati. He was fatally assaulted in New York City, Sept. 16, 1902.

FISH, ROYAL. Certain "great fish," as the whale and sturgeon, which by the common law of England are deemed the property of the crown when either thrown on shore or caught near the coast. The principle applied constitutes an exception to the rule, common to all systems of jurisprudence, that fish, as animals *feræ nature* ('of a wild nature'), belong by finding, or "occu-

pation," to the one who first reduces them to possession. "Our ancestors," says Blackstone, "seem to have entertained a very high notion of the importance of this right, it being the prerogative of the kings of Denmark and the dukes of Normandy; and from one of these it was probably derived to our princes. It is expressly claimed and allowed in the Statute *De Prærogativa Regis* (17 Edw. II, c. 11), and the most ancient treatises of law now extant make mention of it." Strictly it was the head only of the whale which belonged to the King, the tail being a perquisite of the Queen Consort. In Scotland whales thrown on shore above six-horse-power draft belong to the Queen or the Admiral. See GAME LAWS.

FISH, STUYVESANT (1851-). An American banker and railroad official, born in New York City. In 1871 he engaged in clerical work for the Illinois Central Railroad, of which corporation he subsequently became director (1876), second vice president (1883-84), vice president (1884-87), and president (1887-1906). He also held high offices in connection with other roads, among them the Chicago, St. Louis, and New Orleans, from 1883 to 1906 was a trustee of the Mutual Life Insurance Company, and served as trustee of the New York Life Insurance and Trust Company, vice president and director of the National Park Bank, and director in other corporations. In 1904-06 he was president of the American Railway Association and in 1905 chairman of the seventh International Railway Congress. He published *The Nation and the Railways* (1908).

FISH AS FOOD. Fish is almost universally recognized as one of the important food materials and enters into the diet of very many if not most American families. From recent data published by the Bureau of Statistics, United States Department of Commerce and Labor, it appears that the total weight of the fish marketed yearly in the United States is 1,893,454,000 pounds, having a value of \$54,031,000. By the processes of canning, salting, smoking, and otherwise preserving, the value of the fish is very much increased. In addition, thousands of pounds of fish are annually caught by sportsmen, but statistics of the amount are not available. Of the very large quantity of fish annually placed on the American market the greater part is consumed at home, although a portion is prepared in various ways for export. The preference for fresh-water or salt-water fish is a matter of individual taste. Both are, so far as known, equally wholesome. The market value of fish is affected by various conditions. Among these are the locality from which they come, the season in which they are taken, and the food on which they have grown.

Fish are sold either dressed or round, i.e., whole. Sometimes only the entrails are removed. Often, however, especially when dressed for cooking, the head, fins, and, less frequently, the bones, are removed. This entails a considerable loss in weight as well as of nutritive material. In dressing fish the following percentages are commonly lost: large-mouthed black bass, sea bass, cisco, kingfish, mullet, white perch, pickerel, pike, tomcod, weakfish, and whitefish, each, 17 per cent; small-mouthed black bass, eel, Spanish mackerel, porgy, and turbot, each, 13 per cent; butterfish, 12 per cent; shad, 11 per cent; and brook trout, 16 per cent; bullhead, 50 per cent; buffalo fish and lake sturgeon,

40 per cent; carp and sucker, 35 per cent; fresh-water sheephead, 23 per cent; grass pike, black bass, white bass, yellow perch, and salmon, 15 per cent.

Fresh-water and salt-water fish alike are offered for sale as taken from the water, or preserved in various ways. Large quantities of fish are dried, salted, and smoked, the processes being employed alone or in combination. These methods insure preservation, but modify the flavor. Several fish products are also prepared by these processes. For example, caviar, prepared very largely in Russia, and to some extent also in the United States, is usually prepared from sturgeon roe by salting. The methods of salting and packing vary somewhat and give rise to a number of varieties.

When fish is salted or otherwise cured, there is a considerable loss in weight due to removal of the entrails, drying, etc. Codfish loses 60 per cent in preparation for market. If the market-dried fish be boned, there is a further loss of 20 per cent. The loss in weight of pollack is 60 per cent; haddock, 62 per cent; hake, 56 per cent; and cusk, 51 per cent. The canning industry has been enormously developed in recent years, and thousands of pounds of fish, oysters, clams, lobsters, shrimps, etc., are annually preserved in this way. Various kinds of fish extract, clam juice, etc., are offered for sale. There are also a number of fish pastes—anchovy paste, e.g.—and similar products which are used as relishes or condiments. Preservatives such as salicylate of soda were once employed to some extent with fish, and especially oysters, for shipping, but their use has been largely checked by State and national pure-food laws.

Oysters and other shellfish are placed on the market alive in the shell, or are removed from the shell and kept in good condition by chilling or other means. In the shell oysters are usually transported in barrels or sacks. Shipment is made to far inland points in refrigerator cars and to Europe in cold-storage chambers of vessels. Oysters are often sold as they are taken from the salt water. However, the practice of "freshening," "fattening," or "floating" is very widespread—i.e., oysters are placed in fresh or brackish water for a short period, in which they become plump in appearance, owing chiefly to the water taken up by their tissues. They have a different flavor from those taken directly from salt water. Lobsters, crabs, and other crustacea, though sometimes boiled before being marketed, are usually sold alive. Turtle and terrapin are usually marketed alive. Turtle soup, however, is canned in large quantities. Frogs, valued for their hind legs, are marketed alive or dressed in all seasons, but are in the best condition in fall or winter. In addition to the varieties of fish commonly used as food, others, such as the common sea mussel, smooth and horned dogfish, sand shark, and toadfish, which are not found in quantity in the American market, are also edible, and their use would add to some extent to the available supply of sea food.

The average composition of the principal fish, crustacea, etc., used for food is shown in the table below. That of others less frequently eaten is similar.

Fish usually contains less fat than is found in meat. There is, however, much difference in the fat content of the various kinds of fish. They may, indeed, be roughly divided into three

classes: the first class would include those containing over 5 per cent fat; the second those containing between 2 and 5 per cent; and the third those containing less than 2 per cent. The first group would include such fish as salmon, shad, herring, Spanish mackerel, and butterfish; the second, whitefish, mackerel, mullet, halibut, and porgy; the third, smelt, black bass, bluefish, white perch, weakfish, brook trout, hake, flounder, yellow perch, pike, pickerel, sea bass, cod, and haddock.

When judged by its composition, the place of fish in the diet is the same as that of meat; i.e., it is supplementary to cereals and other vegetables, most of which, as wheat, rye, maize, rice, potatoes, etc., are rich in carbohydrates, which are not present in appreciable amounts in the flesh of fish. Preserved fish, as a rule, show a small percentage of refuse, with the exception of a few kinds which are preserved whole. The percentage of actual nutrients is much larger than in the corresponding fresh fish, owing to the removal of a large part of the refuse and more or less water. The gain in nutrients is mostly represented by protein, which is the most valuable nutrient. Canned fish, which is in effect cooked fish, compares favorably as regards composition with the fresh material. Generally speaking, the amount of refuse is small, since the portions commonly rejected in preparation for the table have been removed before canning. Shellfish resemble meat and food fishes in general composition. They contain, however, an appreciable amount of carbohydrates. Judging by the relative amount consumed, oysters are the most important of the shellfish. Speaking roughly, a quart of oysters contains on an average about the same quantity of actual nutritive substances as a quart of milk, or three-fourths of a pound of beef, or two pounds of fresh codfish, or a pound of bread.

A number of experiments have been made with man to learn how thoroughly fish is digested and to compare it in this respect with other foods. It has been found that fish and lean beef are about equally digestible. In each case at least 95 per cent of the total dry matter, 97 per cent of the protein, and 97 per cent of the fat were retained by the body. Other experiments of the same character indicate that salt fish is less thoroughly digested than fresh fish. The nutritive value of shellfish, as of other fish, depends to a considerable extent upon their digestibility; but so little is known upon this point that nothing more can be said with certainty here than that oysters belong to the more easily digestible class of foods. So far as can be learned no experiments have been made which show how thoroughly crabs, clams, and other crustacea, turtle and terrapin, and frogs' legs are digested. Inspection of a considerable number of dietary studies of families of farmers, mechanics, professional men, and others, carried on in different regions of the United States, shows that out of the 20 per cent of the total food and the 43 per cent of the total protein obtained from animal sources, only about 2 per cent of the total food and 4 per cent of the total protein is furnished by fish, shellfish, etc., showing to what a limited extent this valuable food is used in the average household. It is not improbable that in communities where fishing constitutes the principal industry much larger quantities are consumed. It was found that the laborers employed in the fisheries of Russia

consumed from 26 to 62 ounces of fish daily. This, with some bread, millet meal, and tea, constituted their diet throughout the fishing season. These quantities are unusually large, but no bad effects are mentioned as following the diet.

There is a widespread notion that fish contains large proportions of phosphorus and on that account is particularly valuable as brain food. The percentages of phosphorus in specimens thus far analyzed are not larger than are found in the flesh of other animals used for food. But even so, there is no experimental evidence to warrant the assumption that fish is more valuable than meats or other food material for the nourishment of the brain. The opinion of eminent physiologists is that phosphorus is no more essential to the brain than nitrogen, potassium, or any other element which occurs in its tissues. The value commonly attributed to the phosphorus is based on a popular misconception of statements by one of the early writers on such topics. It should be stated that most physiologists regard fish as a particularly desirable food for persons of sedentary habits, since it is easily digested and not too hearty. While, so far as can be learned, such statements do not depend upon experimental evidence, they are thought to embody the result of experience.

In cooking, fish may be boiled, steamed, broiled, fried, baked, or combined with other materials in some made dish. When boiled, it is stated that the loss in weight ranges from 5 to 30 per cent, a loss that consists largely of water—i.e., the cooked fish is less moist than the raw. Little fat or protein is lost. So far as known, experiments have not been made which show the losses by other methods of cooking. It is, however, probable that there would be usually a very considerable loss of water.

In view of statements of a popular nature which have been made on the dangers from eating poisonous fish or from ptomaines contained in fish, a few words summarizing the actual knowledge on these topics seem desirable. There are several species of fish which are actually poisonous. Few of them, however, are found in the United States, and the chances of their being offered for sale are very small. Such fish are mostly confined to tropical waters. Fish may contain parasites, some of which are injurious to man. These are, however, destroyed by the thorough cooking to which fish is usually subjected. Occasionally cases of illness which have been said to be ptomaine poisoning have been traced to eating fish or fish products. Fish which has been frozen and, after thawing, kept for a time before it is cooked is commonly believed to be especially likely to contain injurious ptomaines. It is possible, though, that the illness may be due to bacteria or their spores which are not destroyed by cooking. Canned fish should never be allowed to remain long in the can after opening, but should be used at once. There is some possibility of danger from the combined action of the can contents and oxygen of the air upon the lead of the solder or the can itself. Furthermore, canned fish seems peculiarly suited to the growth of micro-organisms when exposed to the air. Finally, fish offered for sale should be handled in a cleanly manner and stored and exposed for sale under hygienic conditions. Oysters when "floated" or "fattened" should never be placed in water contaminated by sewage. Severe illness and death have resulted in a number of

* Including added salt.

cases from eating raw oysters contaminated with sewage containing typhoid-fever germs.

For further information, consult the authorities referred to under Food; also Atwater, "The Chemical Composition and Nutritive Value of American Food Fishes and Invertebrates," *Report of Commissioner of Fish and Fisheries, 1888* (Washington, 1885); *United States Department of Agriculture, Office of Experiment Stations, Bulletin 28* (revised); Langworthy, "Fish as Food," *United States Department of Agriculture, Farmers' Bulletin 85* (Washington, 1905).

FISH'BERRY, or FISHER'S BERRY. A drug. See COCCULUS INDICUS.

FISH CROW. A small crow (*Corvus ossifragus*), common along the eastern coast of the United States from the Hudson River to Mexico. It is about 16 inches in length, and the plumage is glossed with violet blue on the back, changing to a more greenish tinge on the head and lower parts. It rarely leaves the coast and margins of tidal rivers—where it feeds on small animals and carrion found on the beaches and mud flats, or dexterously seizes floating morsels—except to make excursions in the spring to neighboring woods and fields in search of birds' nests, of which it is a persistent robber. It ascends the Mississippi and other large rivers long distances. Its flight and cry are easily distinguished from those of the common crow, and it does not form great flocks and move regularly to and from the shore, as does that species. It nests in trees, preferring pines. A similar but somewhat smaller and blacker species (*Corvus minutus*) inhabits Cuba. Compare Crow.

FISH CULTURE, or PISCICULTURE (from Lat. *piscis*, fish + *cultura*, culture, from *colere*, to cultivate). The breeding, rearing, transplanting, and protection of aquatic animals in order to maintain or increase their abundance. Literally the term applies only to the culture of fishes, but by judicial decision it has come to include also such forms as the lobster, oyster, clam, and other mollusks used as food or bait, frog, etc.

General Considerations. Increased market demand must be met by increased production. Fish culture is of special economic importance as an extension of the natural method of utilizing terrestrial nitrogenous wastes, and is based upon the fact that soluble chemical substances, the essential food of growing plants, wash from the land. In streams, lakes, and estuaries this plant food causes an abundant crop of microscopic plants and animals (plankton) (q.v.), which is the fundamental food supply of all aquatic animals. Cultivation of water areas offers close parallels with intensive agricultural practices and results. A vast improvement is promised as increasing knowledge of the habits and life history disclose special points of vantage in application of scientific methods, e.g., artificial fecundation of eggs, protection of eggs and young from enemies, segregation of various sizes to check cannibalism, development of methods of feeding, etc. Mollusk cultivation is simple and is carried on extensively in many countries, notably France, Holland, Japan, United States, Italy. About one-half of the world product of oysters results from cultural practices. Similar practices are being extended to numerous other species of food and bait mollusks. In general cultivation consists in catching the floating young (spat, or "seed"), transplantation of immature mollusks to pre-

vent loss by overcrowding or to utilize food-bearing currents, destruction of enemies, etc. The maintenance of artificial ponds for the rearing of fresh-water fishes for food or ornamental purposes is a very ancient practice and is carried on by nearly every civilized nation. In China fish culture has been extensively practiced from ancient times. In Europe, and particularly in Germany and Sweden, pond culture is of considerable importance. In recent years, however, fish culture has become almost synonymous with the harvesting of eggs, their artificial fecundation, and the rearing of the young up to varying stages in hatcheries established for that purpose. This seems to have been an ancient custom in China, where the Europeans probably got their first ideas of modern pisciculture. Both in Europe and America the industry has become of such importance as to be more or less completely supported by government funds. In Europe the hatcheries, over 400 in number, are largely private enterprises, but such are as yet comparatively rare in the United States and Canada. The United States far surpasses all other countries in the extent of this work under government patronage. The Federal government supports 34 hatcheries at various favorable places, and one steamer, the *Fishhawk*, a sort of floating hatchery, exclusively used in the actual culture of fishes or in the investigation of problems pertaining thereto. The number of fish handled in 1913, either as eggs, fry, fingerlings, yearlings, or adults, aggregated 3,863,000. Of this number 85 per cent were fry. Besides these, many of the States support hatcheries for the particular fishes of importance in their territories. (See below.) The purpose of the governmental hatcheries is either to stock new waters with desirable species or to maintain by planting the supply in waters already tenanted.

In most species it is at present impracticable to carry culture much beyond the stage of hatching, or "fry," as the hatchlings are called. This is true of all the strictly marine forms such as the cod and flatfishes. In many of the fresh-water species, such as the various salmon, bass, and sunfishes, they are often nourished and protected in suitable ponds until they have become 1 to 4 inches long—"fingerlings," as they are then called—before planting. They may even be carried for another year and planted as yearlings.

It is now established that waters thus stocked or replenished have not only been able to maintain their supply of fishes, but have greatly increased it. Pacific waters have been successfully stocked with Atlantic species, and almost exhausted streams in various parts of the United States have been successfully restored. In some species the eggs are not handled, but the spawning fishes are provided with favorable ponds for spawning purposes, where their eggs are protected from enemies, given suitable temperature, etc. This is the case with members of the Centrarchidae, such as the black bass, which build a nest and guard the eggs during incubation. The young when hatched are either taken from the ponds and fed in suitable troughs until better able to shift for themselves, or are supplied with food in the ponds themselves. In certain species, where the anatomy of the oviducts permits, however, the eggs are artificially expelled from the body into suitable receptacles, in which they are fertilized by the addition of milt similarly

obtained from the males. After a few moments the eggs are transferred to running water, where they are kept and taken care of until the embryos emerge. The exact method employed in fertilization, but especially the subsequent handling of the eggs during incubation, varies considerably with the character of the egg.

Treatment of Eggs. Nearly all fish eggs are spherical in shape. The true portion, which is heavily charged with yolk, is inclosed by a membrane varying greatly in character. This membrane may be adhesive to any foreign object or to adjoining eggs, or it may be supplied with various modifications of filaments which cause the eggs to become entangled with each other and with foreign objects, such as weeds. These properties necessitate different methods in their handling during incubation. Again, eggs may be pelagic, i.e., buoyant, lighter than the water, or heavy, sinking to the bottom. Some eggs, as those of the whitefish and shad, are only slightly heavier than water, i.e., semibuoyant.

Pelagic eggs belong to the cod, flatfish, mackerel, tautog, etc. Such eggs are incubated in a way quite different from the heavy eggs; in nature they are extruded in the water and rise to the surface, where they develop. Such eggs usually hatch in a very short time, from a few days to two or three weeks. The apparatus now used for hatching pelagic eggs is the McDonald tidal box. The water enters through the cheese-cloth bottom and through a small hole at one end, the latter giving the water and eggs within the box a gentle rotary motion. By means of an automatic siphon the water is also made to rise and fall at short intervals, thus insuring a more perfect renewal.

Heavy eggs, as those of the salmon and trout, are spread out on small wire-bottomed trays. These are placed in tiers in long troughs, into which the water enters at one end and by an arrangement of partitions is made to flow from below upward through the tiers of eggs, thus bathing them, and flowing out at the opposite end of the trough. During development in these trays constant attention is necessary to avoid too strong currents through the troughs, thereby shifting the eggs, and especially to remove the dead eggs, which are attacked by a fungus, and, if allowed to remain, will speedily contaminate the whole lot.

Semibuoyant eggs, as those of the whitefish, shad, and perch, are hatched successfully in the McDonald jar. This has a rounded bottom, and the water is introduced by a glass tube extending through the lid to near the bottom. The water entering gently keeps the eggs in slow motion, to prevent them from "banking" or gathering in lumps. The water escapes through the top by a tube or a sort of spout, carrying with it the young as they emerge from the eggs.

Adhesive eggs, like those of the smelt, are first mixed with starch or "muck" to deprive them of their glutinous properties, after which they are handled like other heavy or semibuoyant eggs.

Treatment of Fry. The successful rearing of fry to later stages was for a long time a problem difficult of solution. This has now, however, been perfected with certain species, like the salmon and trout, to a very high degree. The kind and quantity of water and food and the prevention of diseases are the main points to consider. A large quantity of water at a low temperature is one of the essentials to rapid and

healthy growth of most species, particularly the salmon and trouts. Limited numbers are put in long rearing troughs—usually the same in which they were hatched—and a large volume of water is introduced in one end. The fry when first hatched have a large yolk bag which supplies them with food for four or five weeks. About a week before the entire yolk is absorbed they are moved from the trays into rearing troughs. The time to begin feeding them must be ascertained by trial. If hungry, they will rise to a minute particle of food thrown on the surface of the water. At first it is essential to feed them at frequent intervals, and the quantity at a given time must be carefully gauged to prevent them from gorging themselves and to prevent any excess of food from decaying in the water. Liver chopped to very fine particles is the food commonly used. Later the amount of care necessary grows less, so that one meal per day suffices. Larvæ of flies and various crustacea are then fed to them, and when the fish reaches a considerable size coarsely chopped-up liver, hearts, and fish constitute the main food.

Eggs are not equally hardy at all stages of development. At the time when the eyes begin to show their pigment, or the eggs are "eyed," they are usually transported. This is done in trays, the eggs being properly covered and surrounded by sphagnum moss and kept at a low temperature. This permits the eggs to be transported for thousands of miles without any serious losses. Temporary hatching troughs are built in places out of the way, yet favorable for collecting eggs. The eggs are carried to the "eyed" stage and can then be safely transported to more commodious quarters for further development. The United States Bureau of Fisheries owns four cars especially equipped and exclusively used for the transportation of eggs and young fishes. They are supplied with tanks and cans and suitable means for aerating the water and controlling the temperature.

FISH'ER, or PENNANT'S MARTEN. The largest (except the wolverine) of the fur-bearing carnivores of the weasel family (*Mustelidæ*), called in books "Pennant's marten" (*Mustela pennanti*). It is found in forested and uncivilized parts of Canada and the northern United States, where it formerly ranged southward to Tennessee. It is about 30 inches long, besides the tail, which is 12 inches or so more. In color it is chiefly black, often with gray or brown tints towards the head. It is a fierce nocturnal animal, living chiefly on birds and small quadrupeds and having the general habits of the

marten. Its fur in winter is good and is much used in Europe. The black tail was once a favorite ornament to the caps of the Polish Jews. It is called by the trappers *pelkan*, *wejack*, or perhaps more commonly *black cat*. The name "fisher" is said to be due to the fondness of the animal for the fish with which early trappers baited their marten traps, but more probably arose from misunderstanding of its habits or confusion with the mink. It is a great nuisance to marten trappers whatever bait they use, but is itself taken without difficulty in large traps baited with meat. Consult Coues, *Fur-Bearing Animals* (Washington, 1877), and especially Seton, *Life-Histories of Northern Animals* (New York, 1909).

FISHER, ALBERT KENDRICK (1856-). An American biologist, born at Sing Sing (now Ossining), N. Y. He graduated from the College of Physicians and Surgeons (Columbia University) in 1879. In 1891 he was a member of the Death Valley expedition; for the next six years he made biological surveys in California, Nevada, New Mexico, Arizona, and other States for the United States Department of Agriculture, and in 1899 he joined the Harriman Alaska expedition. In 1906 he was placed in charge of the economic investigations of the United States Bureau of Biological Survey. He was a founder and vice president of the American Ornithologists' Union. He published *Ornithology of the Death Valley Expedition of 1891* (1893), *Hawks and Owls of the United States* (1893), and bulletins of the United States Department of Agriculture.

FISHER, ALVAN (1792-1863). An American portrait painter. He was born at Needham, Mass., and studied under an ornamental painter, whose influence on his style was unfortunate. He painted cattle pictures, landscapes, and portraits with such success that he was enabled to visit Europe in 1825 and study in Paris. Upon his return, finding no demand for landscapes, he painted chiefly portraits. He belonged to what is called the "Boston group" of painters and, together with Doughty, Harding, and Alexander, held a successful exhibition of pictures at Boston in 1831.

FISHER, ANDREW (1862-). An Australian statesman, born in Crosshouse, Kilmarnock, Scotland. He worked as a coal miner and in 1885 went to Queensland, where he was elected to Parliament in 1893 and was Minister of Railways in the Dawson ministry of 1899. After Federation he was elected to the Commonwealth Parliament from Wide Bay; in 1904 was Minister for Trade and Customs; in 1907 became leader of the Labor party; and was Prime Minister for six months in 1908-09, his party losing office partly because it lacked interest in Imperial defense. He formed a second and very powerful ministry in April, 1910, which was defeated at the general election of 1913, when Fisher resigned (June 20) and was succeeded by J. Hume Cook, Deakin's successor as leader of the Liberal party.

FISHER, CHARLES (1808-80). A Canadian statesman. He was born in Fredericton, N. B., and was educated at King's College. He afterward studied law, was admitted to the bar, and in 1837 was elected a member of the Legislative Assembly. He was a member of the Executive Council in 1848-51, was appointed a commissioner to codify the laws of the province in 1852, and was Attorney-General in 1854-61 and

also during part of 1866. Fisher was a strong supporter of responsible government, and for many years was the staunch ally of Lemuel Allan Wilmot (q.v.) in the struggle which established that principle in New Brunswick. In the larger issues which precipitated confederation he was also deeply interested. His advocacy of federal union caused his defeat in 1865, when he was a candidate for the Legislative Assembly, but he was soon afterward elected and in 1866 was one of the representatives of New Brunswick at the Quebec Conference which passed resolutions favoring confederation. In the same year he was one of the representatives of his province at the conference in London, England, at which the terms of the federal union were finally considered and arranged. After the Dominion of Canada was formed in 1867, Fisher was a member of its first parliament. In 1868 he was appointed a puisne judge of the Supreme Court of New Brunswick, a position he filled until his death.

FISHER, CHARLES (1816-91). A comedian who began his career in England, but after 1852 was connected with the American stage. He was born in Suffolk, of a theatrical family, and made his debut in 1844 at the Princess's Theatre, London. He came to this country to join William E. Burton, making his first appearance here as Ferment in *The School of Reform*. His subsequent active life was spent in three companies: with Burton from 1852 to 1861, Wallack from 1861 to 1872, and Daly from 1872 to 1890, when he retired. His best-known parts were Triplet in *Masks and Faces*, Sir Peter Teazle, Jaques, and Graves in *Money*. He was tall and dignified in appearance and an admirable player of old men. He died in New York. Consult Hutton, in *Famous American Actors of To-Day*, ed. by McKay and Wingate (New York, 1896).

FISHER, CLARA (1811-98). A popular actress; after 1834 the wife of the composer J. G. Maeder. She was born in London, July 14, 1811, and first made a sensation on the boards of Drury Lane when she was about 6 years old (Dec. 10, 1817) as Lord Flimnap, the Prime Minister of Lilliput, and in a part in *Richard III*. After 10 years of prosperity in various British theatres, her precocious versatility showing itself even in such an ill-chosen rôle as that of Shylock, she came with her family to America, where she made her appearance late in 1827. Her charms, both as an actress and as a singer, were largely those of manner. Ophelia and Viola were her best Shakespearean parts, and as Lady Teazle she won many successes. Consult the *Autobiography of Clara Fisher Maeder*, ed. by Douglas Taylor (Dunlap Society, New York, 1897), and Ireland, in Matthews and Hutton, eds., *Actors and Actresses of Great Britain and the United States* (ib., 1886).

FISHER, GEORGE JACKSON (1825-93). An American physician, born at North Castle, N. Y., and educated at the New York University Medical School. He was United States examining physician of the Seventh Brigade, New York State National Guard, from 1853 to 1873, and president of the New York State Medical Society in 1874. He succeeded Dr. Samuel D. Gross as the contributor of a "History of Surgery" to the *International Encyclopedia of Surgery* (1886), and published: *On the Animal Substances Employed as Medicines by the Ancients* (1862); *Diploteratology: an Essay on Compound Human Monsters* (1866); *Are Mal-*

formations or Monstrosities of the Fœtus in Utero ever Produced by the Power of Maternal Emotion? (1870); *A Brief History of the Discovery of the Circulation of the Blood* (1877); *Teratology* (1875); *Sketches of Some of the Old Masters of Anatomy, Medicine, and Surgery* (1880-83).

FISHER, GEORGE PARK (1827-1909). An American Congregational clergyman. He was born at Wrentham, Mass., graduated from Brown University in 1847 and Andover Theological Seminary in 1851. In 1854 he was appointed professor of divinity and college pastor of Yale College. In 1861 he was transferred to the professorship of ecclesiastical history in the Yale Divinity School; in 1901 he became professor emeritus. He was a famous teacher and a prolific writer. In 1898 he was president of the American Historical Association. He died Dec. 20, 1909. Among his works are: *Essays on the Supernatural Origin of Christianity* (1865); *History of the Reformation* (1873; new ed., 1906); *The Beginnings of Christianity* (1877); *Discussions in History and Theology* (1880); *The Christian Religion* (1882); *The Grounds of Theistic and Christian Belief* (1883); *Outlines of Universal History* (1885); *History of the Christian Church* (1888); *Manual of Christian Evidences* (1890); *Nature and Method of Revelation* (1890); *The Colonial Era* (1892); *Manual of Natural Theology* (1893); *History of Christian Doctrine*, in the "International Theological Library" (1896); *Brief History of the Nations* (1890).

FISHER, HARRISON (1875-). An American illustrator. He was born in Brooklyn, N. Y., and studied under his father, an artist, and at the Mark Hopkins Institute of Art, San Francisco. At the age of 16 he began his earliest illustrations for a San Francisco paper and was afterward appointed to the staff of *Puck*. He later illustrated for the *Saturday Evening Post*, *McClure's*, *Life*, and other magazines. Among the best known of the books illustrated by him are *The Market Place*, by Harold Frederic; *Three Men on Wheels*, by Jerome K. Jerome; *The Eagle's Heart*, by Hamlin Garland. His facility of execution is remarkable, and he is a faithful delineator of character. His well-known type of the "American Girl" is the usual idealized one popular in modern illustration. He excels in details of dress. In 1907 he published a collection of drawings entitled the *Harrison Fisher Book*.

FISHER, HERBERT ALBERT LAURENS (1865-). An English historian and educator, born in London. He studied at Winchester, at New College, Oxford, and in Paris and Göttingen. He was fellow of New College and of Winchester College and (1907) of the British Academy, and in July, 1912, succeeded Sir Charles Eliot as vice chancellor of Sheffield University. In 1912-13 he was a member of the Royal Commission on the Public Services of England. In 1909 he was a lecturer of the Lowell Institute in Boston. His principal works are: *The Mediæval Empire* (1898); *Studies in Napoleonic Statesmanship* (1903); *History of England, 1485-1547* (1906); *Bonapartism* (1908); *Life of F. W. Maitland* (1910); *The Republican Tradition in Europe* (1911); *Political Unions* (1911); and a short study, *Napoleon Bonaparte* (1913).

FISHER, IRVING (1867-). An American economist, born at Saugerties, N. Y. He graduated from Yale (A.B., 1888; Ph.D., 1891), where

he remained as member of the faculty, becoming professor of political economy in 1898. He had spent 1893-94 in study at Berlin and Paris. From 1896 to 1910 he edited the *Yale Review*. He was a member of Roosevelt's National Conservation Commission. His publications include: *Mathematical Investigations in the Theory of Value and Prices* (1892); *Elements of Geometry*, with A. W. Phillips (1896); *A Brief Introduction to the Infinitesimal Calculus* (1897); *The Nature of Capital and Income* (1906); *The Rate of Interest* (1907); *National Vitality* (1909); *Introduction to Economic Science* (1910); *The Purchasing Power of Money* (1911; 2d ed., 1913); *Elementary Principles of Economics* (1911; 3d ed., 1912).

FISHER, JOHN (c.1459-1535). An English churchman. He was born at Beverley, Yorkshire, was educated at Michaelhouse, now incorporated with Trinity College, Cambridge, where he took his master's degree in 1491, and became master of the college in 1499. The same year Margaret, Countess of Richmond, mother of Henry VII, made him her chaplain and confessor. In 1501 he was elected vice chancellor of the university and in 1503 became the first Lady Margaret professor of divinity. In 1504 he was chosen chancellor of the university, and the same year he was appointed Bishop of Rochester. The Reformation of Luther found in him a strenuous opponent. He refused to declare the marriage between Henry VIII and Catharine of Aragon—whose confessor he was—illegal and thereby won the King's hostility. He opposed the suppression of the lesser monasteries in 1529 and the acknowledgment of the King as head of the church in 1531. He was imprisoned, and, refusing to take the oath affirming the legality of Henry's marriage with Anne Boleyn, he was committed to the Tower Feb. 16, 1534. He was treated with great rigor, and his bishopric was taken from him. While thus situated, the Pope, Paul III, as a recognition of faithful services and just merit, sent Fisher a cardinal's hat, in entire ignorance of his rupture with the King. The result was his ruin. He was accused of high treason and after a brief trial was condemned and executed June 27, 1535. Fisher's Latin works were published at Würzburg in 1597; an edition of his English works was begun by J. E. B. Mayor (vol. i, 1876) and continued by Ronald Bayne. Consult his *Life*, by Lewis, ed. by Turner (London, 1855), and by Bridgett (ib., 1890); also Mason, *Lectures on Colet, Fisher, and More* (ib., 1895).

FISHER, JOHN (1569-1641). An English Jesuit and theologian, really named Percy. He was born at Holmside, Durham, and was educated at the English colleges in Rheims and Rome and ordained in 1593. By 1594 he became a member of the Society of Jesus and soon afterward suffered religious persecution in Holland and England. Escaping from prison, he traveled to northern England as a missionary and was instrumental in the temporary conversion of William Chillingworth to Catholicism. Again arrested, in 1610, he was condemned to death, but was banished to Brussels instead and became professor at Louvain. He returned to England to be kept for three years in prison. He was an able debater with prominent Protestants and was favored for a time by the Stuarts; but the Jesuits were subject to severe penal laws, and he suffered further banishment, followed by imprisonment on his return. His

published writings consist of theological disputations. Consult *Conference between William Laud, Archbishop of Canterbury, and Mr. Fisher, the Jesuit*, ed. by Simpkinson (London, 1901), a summary of a debate between the two in an attempt to influence the Countess of Buckingham, whom Fisher brought into the Roman church.

FISHER, JOHN ARBUTHNOT FISHER, first BARON (1841-). An English naval officer. He entered the navy in 1854 and took part in the Crimean campaign of 1855 and in the China war of, 1859-60. In the Egyptian campaign of 1882 he was captain of the *Inflexible* at the bombardment of Alexandria. From 1886 to 1891 he was Director of Naval Ordnance and in 1892-97 was Lord of the Admiralty. He was a delegate to the Peace Conference at The Hague in 1899 and commander in chief of the Mediterranean station from 1899 to 1902. In 1909 he was criticized by Lord Charles Beresford, but after an investigation he was raised to the peerage as Baron Fisher of Kilverstone, Norfolk. Early in 1910 he retired from his post as First Sea Lord of the Admiralty, but was reappointed in October, 1914. He acted as chairman of a royal commission (1912) on oil fuel for the navy.

FISHER, JOSHUA FRANCIS (1807-73). An American author, born in Philadelphia. He graduated in 1825 at Harvard and was admitted to the bar in Philadelphia in 1829, but did not practice. He became an incorporator of the Pennsylvania Institution for the Instruction of the Blind and a student of questions of United States, in particular of Pennsylvania, history. His chief publication was *The Private Life and Domestic Habits of William Penn* (1836). He wrote also: *The Degradation of our Representative System and its Reform* (1863); *Reform of Municipal Elections* (1866); *Nomination of Candidates* (1868).

FISHER, PAYNE (1616-92). An English poet and political satirist. He was born at Warnford, Dorsetshire, and was educated at Oxford and Cambridge, but went soldiering to Holland in 1638. The following year found him in the English Royalist army, where he made the acquaintance of Lovelace and afterward fought under Prince Rupert; but after Marston Moor he joined the ranks of needy literary men in London. He grew in favor with the Parliamentarians and was Cromwell's poet laureate, writing Latin verse to order in a highly panegyric style. At the Restoration he merely changed his dedications, but, despite the satirical pamphlets he directed against his late patrons, he fell out of favor at court and died poor. In Fleet Prison he wrote *Tombs, Monuments, and Sepulchral Inscriptions* (1684), a prose description of landmarks which were destroyed in the great fire.

FISHER, SYDNEY ARTHUR (1850-). A Canadian statesman. He was born in Montreal, was educated at the Montreal High School and McGill University, and in 1871 graduated at Trinity College, Cambridge University, England. He early devoted himself to scientific farming, fruit growing, and the improvement of live stock. Though in 1880 unsuccessful as a Liberal candidate for the House of Commons, he was elected two years later, retaining his seat in the House until 1891. In 1896 he was again elected, and in the same year was appointed Minister of Agriculture in the cabinet of Sir Wilfrid Laurier, a position which he held until the defeat of the Liberals in 1911. In 1891 he was

elected a member of the Quebec Council of Agriculture, and he was also one of the founders of the Provincial Fruit Growers' Association and became closely identified with several other organizations for the conservation and improvement of the farming interests of his province and of the Dominion. In 1909 he was appointed a member of the Royal Conservation Commission and in the same year was a Canadian delegate to the conference at Washington to consider the conservation of the natural resources of the American continent. In 1908 he was elected first vice president of the general assembly of the International Institution of Agriculture at Rome, Italy. While Minister of Agriculture he promoted important legislation. As a prominent temperance worker, he was for some time vice president of the Quebec branch of the Dominion Alliance. He was chief founder of the National Art Gallery and the Archives Bureau at Ottawa. He published: *Some Economic Aspects of Agriculture in Canada*; *Conservation of our Natural Resources*; *Rural Education in the Province of Quebec*; *Canada and its Position in the British Empire*.

FISHER, SYDNEY GEORGE (1856-). An American lawyer and writer, born in Philadelphia. He graduated at Trinity College in 1879, studied at the Harvard Law School for two years, and in 1883 was admitted to the bar at Philadelphia. Besides magazine articles, his popular writings on American history include: *The Making of Pennsylvania* (1896); *Pennsylvania, Colony and Commonwealth* (1897); *The Evolution of the Constitution of the United States* (1897); *Men, Women, and Manners in Colonial Times* (2 vols., 1898); *The True Benjamin Franklin* (1899); *The True William Penn* (1900); *The True History of the Revolutionary War* (1902); *The Struggle for American Independence* (1908); *The True Daniel Webster* (1911).

FISHER, WALTER LOWRIE (1862-). An American lawyer and public official, born at Wheeling, W. Va., and educated at Marietta (Ohio) and Hanover (Ind.) colleges. Admitted to the bar in 1888, he practiced until 1911 and after 1913 in Chicago, which city he served as special assessment attorney in 1888-89 and as special traction counsel in 1906-11. From 1911 to 1913 he held the portfolio of the Interior in President Taft's cabinet. He was president of the Municipal Voters' League (1906) and of the Conservation League of America (1908-09) and vice president of the National Conservation Association (1910-11) and of the National Municipal League. He published an *Address on Alaskan Problems* (1911) and *Alaskan Coal Problems* (1912).

FISHERIES. The capture of various kinds of fish for the purpose of trade has always been extensively carried on in maritime countries and in those which are watered by large rivers and has been the means in many instances of adding greatly to their prosperity. The art has been brought only by degrees to its present perfection, but in nothing did primitive man exhibit greater ingenuity and skill than in the taking of fish. These were effectively preserved and formed a large element in savage sustenance and barter in all parts of the world. The importance of fisheries in the food supplies of nations, inland as well as maritime, and as offering a remunerative return for labor, can scarcely be overestimated. The value of the food fish taken from

the oceans and inland waters of the world amounts to nearly \$400,000,000 per annum, or an average of more than \$1,000,000 per day. One great peculiarity of this source of wealth is that the sea harvest is ripened without trouble or expense for the fisher, who only requires to provide the means of gathering it. But with increasing population the demand for food requires efficient methods not alone of capture, but of wise conservation of the sources of supply, based upon knowledge of the life histories and the interrelations of the food supplies of the various species of fish. Not only are the usual methods of fishing unnecessarily destructive of young and of breeding adults, but little thought is taken to destroy the enemies or to increase the natural food of the most valuable market fish or to prevent the destruction of the spawning beds. The coming of man as an enemy of the adult fish is causing changes in marine life and environment which, though for the most part unseen, are similar to those readily observable on land. The future development of the fisheries is likely to follow the closer utilization of waste products, more efficient methods of distributing and marketing fresh fish for food, elimination of unnecessary destruction of young and of breeding fish and of ripe spawn, commercial utilization of dogfish and other sharks for food, oil, and fertilizer, together with chemical treatment of their products to secure wider utilization. The fisheries will profit by legislation which aims to increase production, to preserve natural spawning grounds from depletion and pollution, rather than that which restricts the demand by prohibition of the use of improved apparatus.

Means of Capture. Lines.—The principal means of capturing fishes are the hook and line and nets. Hand lines are such as are manipulated with the hand. They have one or several hooks and are set, or sometimes are drawn or "trolled" through the water from a boat. The black bass, bluefish, pickerel (q.v.), and other predacious species are taken by this method. The hand line is much used for ordinary fishing, but where this is carried on extensively at sea a "set" or "long" line must be used. This is known in America as a *trawl*. These set lines vary with the kind of fishing, but they are all built on the general plan of a long line, to which at intervals shorter lines bearing the hooks are attached. The line is weighted at the ends or at intervals. It may be provided with floats at intermediate distances, so that the hooks near the weights catch bottom fishes and the others those at middle depths. These lines, operated from dories or directly from the vessel, are set in varying lengths, but a well-equipped fishing schooner will operate several miles of trawl, carrying 10,000 to 15,000 hooks. The boats from which so extensive lines are operated are provided with winches to bring up the lines from the great depths.

Nets and Weirs.—The primitive weir of stones, plaited wood, etc., was early superseded by pliable nets of cord, which have become progressively more elaborate. The principal nets now in use are seine, purse seine, gill net, beam, and otter trawls. The seine is a long net of varying depth, weighted along the lower edge to keep this at the bottom, while the upper edge is provided with floats sufficiently strong to support the seine and keep it vertically stretched. It is usually intended to be dragged to the shore

or to some prearranged platform; but many modifications have been devised to meet special conditions. One form for use in the open sea, called a "purse net," has a rope along the bottom by which that part may be gathered together, forming a deep bag, within which the fishes may be crowded into a small space near the surface and then dipped out. Pound nets and fyke nets are seines with a fixed location acting as traps. Pound nets consist of a long wing, or "leader," supported on stakes, and forming a fence which runs from near shore out to varying distances, and terminates in a labyrinthine inclosure forming a trap. Fishes swimming against the wing and seeking to pass around it are led out to the trap, entering which they are imprisoned. The pound net is simply a modern and improved form of the ancient weir (still in service in various parts of the world), which was composed of stakes and wattle or lines of planted brush instead of netting. Fyke nets are long, cylindrical bags, supported at intervals by hoops. The entrance is by a funnel leading into one or more compartments, separated by similar funnel-shaped partitions, through which the fish will not return. This net may be supplied with wings, like the ordinary pound net or weir, leading the fish into the funnel opening. Fykes are set at the bottom and may be used at considerable depths. Gill nets or drift nets are extensively used both in the seas and in inland waters, since they are suitable to any water of sufficient depth to float them properly. They are set or drifted across channels or across the course of migration of fishes. Schools of fishes, striking the net, will become entangled. This is one of the favorite methods for capturing species which move in schools at or near the surface, such as the herring, and which cannot be easily trapped or taken with the line. In America the "long line" is known as a trawl, but in England this term refers to a large, purse-shaped net attached to a front beam, which is weighted and dragged at varying depths near or along the bottom for bottom fishes, such as soles and flounders. This is one of the principal methods of fishing in the British waters. Trawls are often of great size, 75 to 100 feet in length, with a mouth which may exceed 100 feet in transverse diameter, and may be used at great depths, requiring vessels of considerable strength; but the "beam" trawl is now being superseded by the "otter" trawl, a similar but more efficient device. For the beam are substituted two "otter boards" which act like the runners of a sled. These boards are hung at such an angle on either side of the mouth of the baglike net, that when drawn through the water (usually running on the bottom of the sea) spread the mouth of the net. In Europe over 2200 powerful steamers equipped with otter trawls are engaged in the marine fisheries. The use of this latest type of machinery for harvesting the fish crop must be accompanied by corresponding intelligent activities to increase the productive capacity of the ocean. (See FISH CULTURE.) For information as to towing "intermediate" deep-sea nets and dredges, see DEEP-SEA EXPLORATION.

Preparation and Preservation of Fish. A matter of great importance to the fishery industry is the proper preparation of the raw product for the market. The markets are generally distant from the point of capture; moreover, the season during which any species can be taken in

paying quantities is usually limited. This necessity has given rise to numerous methods of preservation, all of which are modifications of drying, salting, smoking in various degrees and combinations, and as later developments to canning, icing, and freezing.

In Drying, fish are usually first subjected to a salt cure, but under some circumstances may be directly dried. The process varies with different species, climates, and nations, but in general is as follows: The fish are cleaned and split. They are then salted, either with dry salt, allowing the pickle which forms to run off, or in brine vats, where they remain until ready for market. They are then subjected to the drying process in the sun, much care being essential to prevent too strong sunlight acting upon them. For markets in the tropics it is essential that most of the water be extracted, but for sale in the United States the fish are much less thoroughly dried.

For Pickling, brine is almost exclusively employed in the United States. The fish are cleaned, split, and packed in salt. Brine is then added. The principal fishes pickled are the mackerel and the herring.

Smoking Fish is an old and common practice. Smoking is a powerful preservative and adds a desirable flavor to the flesh. The fish are usually slightly cured with salt first, then smoked for a varying length of time—2 to 10 days. Oily species, such as the herring, haddock, halibut, salmon, etc., are those most generally smoked.

In Canning, the flesh is subjected to high temperatures (boiled), placed in cans, and hermetically sealed, after which the cans are subjected to water heated to a high temperature and under pressure. Fish may be (1) plain boiled or steamed; (2) preserved in oil; or (3) prepared in vinegar, sauces, and spices. Among the more important fishery products canned are the salmon, sardine, lobster, shrimp, crabs, oysters, and clams.

Freezing.—For transportation of fresh fish and for their preservation the freezing method is generally adopted. For transportation they are usually simply packed in ice. To preserve them for long periods in the fresh condition they are frozen into blocks of various sizes. The fish are packed into a pan of the desired shape and size, and then subjected to very low temperatures, either through the ice-and-salt method or by the ammonia method. Frozen into blocks, they are stored until ready for the market. By improved methods whereby evaporation is checked frozen fish should lose none of their good flavor and firmness during storage. On the Atlantic coast the bluefish, halibut, squeteague, sturgeon, mackerel, flatfish, cod, haddock, swordfish, red snapper, Spanish mackerel, eels, etc., are thus preserved. On the Pacific coast the salmon, sturgeon, and halibut are principally frozen. On the Great Lakes the lake trout, lake herring, wall-eyed pike, black bass, perch, sturgeon, etc., are frozen. The comparatively recent perfection of the methods of refrigeration has greatly increased the consumption of fresh fish and has enabled consumers to enjoy many species fresh at a season in which formerly they could be had only in a smoked or salted condition. The extensive inland trade in the United States, and the liability of stored products to rapid decay, have given rise to an elaborate system of refrigerator railroad cars for their imperishable transportation.

Special Fisheries. Special fisheries develop wherever the various species of fish resort in quantities either to feed or to breed. Such fisheries may be a permanent asset if the destruction of adults or young is not permitted to become excessive, if the natural mortality can be lessened, or if unwise destruction of other species which serve as food—e.g., young alewife, herring, menhaden—does not so reduce the supply that the more valuable fish—e.g., mackerel, pollack, bluefish, et al.—no longer resort there to feed.

The Sturgeon.—Sturgeons are the objects of rather extensive fisheries in both Europe and America; in China they are also important. In Europe the Russians lead in the sturgeon fishery. In the United States the industry is of comparatively recent origin, but is already rapidly declining because of the exhaustion of the supply through indiscriminate destruction of the fish of breeding age as they approach the spawning grounds. In the United States sturgeon are taken principally by the gill net and set lines, though many are also taken in pound nets and seines. The flesh is almost exclusively prepared by smoking, and in both Europe and North America the roe is prepared into caviar. The swim bladder is used for isinglass; oil is obtained, and the refuse is used as a fertilizer. From a maximum of 15,000,000 pounds in 1890 the yield of sturgeon in the United States has fallen to less than 1,000,000 pounds in 1913. In Russia the value of caviar is nearly \$4,000,000 annually, mainly marketed in southwestern Europe. In the United States the production of caviar amounts to about \$100,000 per annum.

Herring.—Under the head of herring fisheries may be considered all the clupeiform fishes, such as shad, herring, alewife, sardine, and menhaden.

The true herring, or sea herring (*Clupea harengus*), is undoubtedly the most important food fish in existence, although in the United States its importance is much less than that of many other species. The total annual catch for the world has been estimated at about 1,500,000,000 pounds, the greater part of which is taken in Norway. The annual catch in the United States is about 125,000,000 pounds, with a first value to the fisherman of \$800,000. The herring are principally taken with seines, gill nets, and weirs. They appear in the markets in three principal forms, viz., fresh, pickled, and smoked. In the United States there are annually frozen about 20,000,000 herring, with a market value of about \$250,000. About one-third of these are used as bait for cod; the remainder are consumed as fresh food. They thus afford an excellent fresh-fish food at seasons when other fresh fish are difficult to get. The quantity of herring prepared in pickle is greater than that of all other species combined. Over 3,000,000 barrels is the annual product for the world. They appear in the markets in two principal forms—"round" and "split." In the former they are salted without the removal of gills, heart, and viscera, while in the latter they are eviscerated. They are prepared for the markets as "hard" or "red" herring and "bloater" herring, the latter being a form and term used mainly in England and originating chiefly at Yarmouth. The former differ from the latter in being subjected to the smoke at a lower temperature and for three or four weeks, while the latter are smoked at a comparatively high temperature and only for two and a half to six days. The bloaters do not have the keeping

qualities of the hard herring. In Maine young herring are extensively canned as sardines. In spite of the great increase in the herring fisheries and the enormous quantities annually taken, the abundance of the species has not perceptibly diminished, though, in part at least, this fact may result from the destruction by man of larger species, e.g., mackerel, pollack, bluefish, et al., which feed upon the young as well as upon the mature herring.

The *Shad* (*Alosa sapidissima*) is the object of the most extensive fisheries in the United States, where it is the most important food fish excepting the cod and the salmon. The original fisheries are located along the entire Atlantic coast streams. This fish, introduced by the United States Bureau of Fisheries into the Sacramento River, has spread along the entire Pacific coast northward to Alaska. Shad are taken during their entrance into the fresh-water streams for the purpose of spawning and are captured by seines, gill nets, and pound nets in great quantities. The annual yield for recent years has averaged about 25,000,000 pounds in the United States, with a first value of \$2,000,000. The catch is diminishing in quantity, but the value is slightly increasing. Most of the shad are consumed fresh, being iced for shipment. A few are brine-salted, and some are smoked. The eggs of shad are to some extent made into caviar and offer the best substitute for the sturgeon roe.

The *Alewife* (*Pomolobus pseudoharengus*) is the most abundant food fish in the east coast rivers of the United States, and next to the shad is the most important of the anadromous fishes of the Eastern States. Alewife fisheries are to be found in every Atlantic State. The catch amounts to about 80,000,000 pounds per annum, with a value of \$600,000. They are principally caught in seines and pound nets during their migrations up the streams for spawning purposes; many are also taken with gill nets, fykes, and even with dip nets. A nearly related species, the glut herring (*Pomolobus aestivalis*), is of less importance, and more common in the Southern States. Alewives are used fresh for food, as bait for line fisheries, and are extensively brine-salted and smoked.

The *Menhaden* is the object of an important fishery in the United States. This fish (*Brevoortia tyrannus*) occurs along the entire east coast of the United States and is more abundant south, but is of no special value as food except for other fishes. It is canned, and salted to a limited extent, and some are eaten fresh. Their principal value lies in the oil extracted from them and in their use as fertilizers. They are uncertain in their movements, but in favorable years over 50 vessels may be employed in the catch. The annual catch is about 400,000,000 pounds, valued at nearly \$1,000,000.

The *Sardine* fisheries are pursued in three principal regions, viz., the Mediterranean coasts, the coast of the Bay of Biscay, and the coast of Maine; but sardines are prepared in other places, such as Brazil and Mexico. The European sardine, or pilchard (*Clupea pilchardus*), is the common form there. In the United States nearly related species are used, also the young of the sea herring, and to some extent young menhaden. This industry is of comparatively recent origin in the United States, dating from 1875. The European amounts are much greater, France, Spain, Portugal, and Italy being heavy producers. The importations of sardines and other fish

packed in oil into the United States amount to about \$2,000,000 per annum in value, and are chiefly from France, Italy, and England. In the markets sardines appear in the canned form, put up in olive and other kinds of oils. This industry has reached its highest development in Brittany.

Another group of important fisheries is that concerned with the several salmonoid fishes. Among these are to be included the salmon, whitefishes, and smelt.

The *Salmon* are undoubtedly the most important group of fishes entering the rivers of North America, and a considerable number of salmon are taken in northern Europe and eastern Asia. The catch of the British Islands in 1912 amounted to about 4,971,559 pounds. In North America the most important fisheries are on the Pacific coast. The most important species is the Chinook, or quinnat, salmon (see SALMON); the next in importance is the abundant blue-back salmon, followed by the silver salmon, steelhead, etc. They are taken during their ascent up the streams by the usual appliances, together with the unique fishing wheel. Salmon are marketed as fresh, smoked, and canned. The canning of salmon has become one of the great industries of the world. Of the world's annual output over 95 per cent is prepared on the American continent. The salmon pack of the canneries of North America in 1913 was 8,063,447 cases (of 48 pounds per case), valued at \$38,563,891; of which 3,475,000 cases, valued at \$13,860,000, was Alaskan, 2,583,000 cases, valued at \$13,320,000, Puget Sound, 288,479 cases, valued at \$2,012,000, Columbia River, and 1,354,000 cases, valued at \$8,800,000, British Columbian product. The export trade, at first mainly with South America and Australia, now also includes Great Britain and other European countries. The export of canned salmon ranges from 30,000,000 to 60,000,000 pounds per annum, valued at from \$3,000,000 to \$6,000,000 annually. Smoked salmon are among the choicest of fishery products, but the proportion of the salmon catch thus cured is extremely small.

The *Whitefish* (*Coregonus clupeaformis*) and the ciscos or lake herring (*Argyrosomus arctedi*) are highly important salmonoids. Species of these two genera are found in the lakes of northern Asia, Europe, and North America, and all are valued as food. The whitefishes are among the most important fresh-water fishes of the world. The catch of lake herring and whitefish in the United States and Canada for the year 1908 aggregated about 25,000,000 pounds, with a value of about \$1,500,000. Of this catch about 7,800,000 pounds were taken in the United States, with a value of \$524,000. Most of these are taken in gill nets, but many also in pound nets, trap nets, and seines. Whitefish and herring are extensively frozen in the Great Lakes region and are thus served fresh to the markets. Large quantities were formerly brine-salted, but this industry has almost wholly disappeared since the frozen-fish industry has developed. Whitefish were formerly extensively smoked, but the scarcity of this species has resulted in the substitution of the lake herring.

The *Lake Trout* (*Cristivomer namaycush*) is next to the whitefish in importance in the Great Lakes fisheries. The disposition of these is much like that of the whitefish, and they are taken by gill nets, pound nets, hook and line, and in winter through the ice by spearing.

The *Smelt* (*Osmerus*), although the smallest of the salmonoids, is of great importance. The annual catch in the United States is about 4,000,000 pounds, with a value of \$175,000. The catch in the Canadian fisheries aggregated over 10,000,000 pounds, valued at about \$900,000 in the year 1912. They are largely taken by seines. Smelt are canned to some extent, but the great bulk of them are marketed fresh, being extensively preserved in cold storage.

The *Mackerel* is one of the most valuable food fishes in the Atlantic, and great fisheries for it are carried on in Great Britain, Ireland, Norway, Canada, and the United States. Lines, purse seines, and gill nets are the principal apparatus used. The most important of the several species, the common mackerel (*Scomber scombrus*), is found on both sides of the Atlantic and appears near shore in enormous schools. They appear in the spring, coming shoreward earlier in the more southern latitudes, and in autumn they return to the deeper waters. The European catch is usually limited enough to be mostly marketed fresh, but in the United States and Canada large quantities are cured. In North America most of the mackerel fisheries are on the east coast. The catch in the United States is now much less than formerly, and amounted in 1908, the latest census report on fisheries, to 12,742,000 pounds, valued at \$864,000; that of Canada, in 1913, 11,400,000 pounds, valued at \$635,293; that of England and Wales, in 1913, 34,000,000 pounds, valued at about \$1,000,000. The world's catch so far as known amounts to about 125,000,000 pounds per annum, valued at approximately \$5,000,000. In the United States the proportion of salted mackerel to the total catch was in former years above 80 per cent, but in recent years it has been much less. The increasing demand for fresh mackerel is in part responsible for this decrease.

The Spanish mackerel, one of the choicest food fishes, is taken in considerable quantities along its entire range on the east coast of the United States, but principally south. It is taken in seines, gill nets, pound nets, and lines.

The tunny, or horse mackerel, which may reach a weight of 1000 to 1500 pounds, is a mackerel of most excellent flavor and is the object of extensive fisheries in southern Europe. In California it is much sought by sportsmen, and is taken in considerable quantities off the coast of New England.

The *Cod*.—One of the world's greatest fisheries, is that relating to the several species of the cod family (*Gadidæ*). These are common in the northern regions of both oceans. The more important species are the common cod, haddock, pollack, and hake. The countries principally engaged in the cod fisheries are Newfoundland, Canada, the United States, France, Great Britain, and Norway and Sweden, with a total annual product worth about \$40,000,000. The common cod (*Gadus callarias*) is the most important and is found on both sides of the Atlantic. It is taken with hand lines and trawl lines from rather deep waters—20 to 70 fathoms. The annual catch for the United States has in recent years averaged about \$3,500,000, first value. The catch in 1913 for Canada amounted to \$8,368,000. The haddock is extensively taken in both Europe and America. The product of Canada amounted to \$1,065,000 for the year 1913. In the United States the annual yield is about 60,000,000 pounds, with a value of about \$1,300,000. The

pollack is found on the east coast of North America north of New Jersey. The annual catch in the United States amounts to about \$100,000, the Canadian product amounting to \$325,000 in 1910.

The various species of cod are marketed fresh, dried, pickled, and smoked. Very small quantities are pickled in the United States, and almost the only species smoked is the haddock. The principal form in which they are cured is by salting and drying. The world's annual product of dried codfish aggregates 400,000,000 pounds, representing 1,500,000,000 pounds of the uncured fish. The chief markets are France, Spain, Portugal, Italy, and Brazil. The bulk of this trade is carried on by Norway, Newfoundland, and Canada, and it has been steadily increasing in these countries, while in the United States the reverse is the case. Our exports of dried cod in 1804 amounted to \$2,400,000, while the average annual export for the 10 years prior to 1914 averaged less than \$200,000 per annum. The total amount of dried codfish prepared in the United States annually is about 30,000,000 pounds. Haddock are extensively smoked, appearing on the market as "finnan haddie." The secondary products of the cod are of considerable importance. These are oil, isinglass from the air bladders, glue, etc.

Halibut, etc.—Nearly related to the *Gadidæ*, and like them of great importance, are the flatfishes (*Pleuronectidæ*). The fisheries are extensive in both Europe and America. Flatfishes are bottom fishes, and many of them are found in deep waters. The principal means of capture, therefore, are the hook and line, haul seines, pound nets, and the beam and "otter" trawl. The latter method is almost exclusively used by the North European countries. The most important of these fishes and one of the most toothsome is the large halibut, found in all northern seas. It may attain a weight of 400 pounds, though the commoner weight is less than half this. The great fishing grounds for the Atlantic trade of the United States are Grand Bank, Western Bank, Iceland, and Greenland. The Atlantic fishing has been seriously depleted by overexploitation. The chief source of supply of North America now is near the waters of Puget Sound and Alaska, with a reported catch of 35,000,000 pounds in 1912. They are iced, and upon arrival are further prepared for sale either fresh or smoked. The most of the halibut are cured by smoking. The annual product, larger now than in former years, averages about 34,000,000 pounds, with a value of about \$1,600,000. The Canadian catch of halibut in 1910 amounted to 23,000,000 pounds, with a value of \$1,240,486. Two other species of considerable size are found in the American markets: the Greenland halibut, found in the Arctic parts of the Atlantic but not very common, and the Monterey halibut, common along the coast of California. In European waters the sole (*Solea vulgaris*) is the common flatfish taken for the markets.

Mollusk Fisheries.—By judicial decision the taking of oysters, clams, quahogs, scallops, and other food and bait mollusks are "fisheries." In 1910 the oyster fishery alone employed over 67,000 persons, at a yearly wage of \$11,000,000, an investment of \$17,000,000, with an output of 33,000,000 bushels, valued at \$15,000,000. Of this yield approximately one-half was the result of artificial propagation. See FISH CULTURE.

Lesser Fisheries.—In addition to the foregoing

more important families of fishes there are many others whose species are not so generally important, and which are not the object of so extensive special fisheries.

The most important member of the minnow family in America and Europe is the carp. In Europe it is extensively reared in artificial ponds, and in the United States upon introduction it becomes notoriously abundant. Its flesh is not highly esteemed in the United States, though extensively taken for the markets, where it frequently appears under a variety of names.

The suckers (Catostomidae) are much eaten in the Mississippi valley. The most important of these are the buffalo fishes, the catch of which in 1908 was 8,555,000 pounds, with a value of \$215,000.

Of greater commercial value than the suckers are the catfishes (Siluridae). The catch in the Mississippi valley amounted to 17,117,000 pounds in 1908, valued at \$785,000.

The fresh-water sheepshead (*Aplodinotus grunniens*) yielded 2,637,000 pounds in 1908, with a value of \$97,000. Along the east coast the salt-water sheepshead (*Archosargus probatocephalus*) is generally regarded as one of the choicest food fishes. The squeteague, or weakfish, and the spotted weakfish are extensively taken along the east coast of the United States.

The sea basses (Serranidae) include many important species, used as food in different regions of their world-wide distribution. In the United States the striped bass (*Morone lineatus*) and the white perch (*Morone americana*) are among the important species. The groupers are abundantly found in the markets, especially in the southern United States and in Brazil. These are not infrequently found of great size in the markets, but are of more practicable value as objects of sport.

Various species of pickerel (Luciidae) are of some importance in the northern United States and Europe. The most familiar one is the common pike, or pickerel, abundant in northern regions. The Canadian maskinonge (q.v.) reaches a weight of 100 pounds or more.

Swordfish (*Xiphias gladius*) is a recently developed food fishery off the New England coast. In 1913 upward of 2,000,000 pounds were landed at Boston.

The large and small-mouthed black bass and other sunfishes, such as the rock bass, crappie, etc., are taken in considerable quantities for the markets in the United States, and the first named has been introduced into other countries where they are now marketed. The market value of the black bass to the fishermen in the United States is about \$250,000, representing 3,000,000 pounds of fish. The annual catch of crappie is about 3,000,000 pounds.

The mullets are commonly found in the markets of both North and South America, the catch in the United States being about 35,000,000 pounds, valued at nearly \$1,000,000 annually.

Products for Food," in the United States Fish Commission's *Bulletin for 1898* (Washington, 1899), contains a thorough account of the methods of preserving aquatic products in the United States and also of other countries, their commercial value, etc.; Simmonds, *Harvest of the Sea* (London, 1865); id., *Commercial Products of the Sea* (ib., 1883); id., *The Sea Fisheries of Great Britain* (ib., 1883); Cunningham, *Natural History of Marketable Marine Fishes* (New York, 1896); Bowers, *Artificial Propagation of Marine Species* (Washington, 1904); McFarland, *A History of New England Fisheries* (New York, 1911); Herubel, *Sea Fisheries* (London, 1912); also *Bulletins of the International Council for the Study of the Sea*.

FISHER'S ISLAND. An island about 6½ miles southeast of the harbor of New London, Conn., at the east entrance of Long Island Sound (Map: Connecticut, H 4). It belongs to Southold Township, Suffolk Co., L. I., and is about 8 miles long and 1 mile or less wide, with an area of about 4000 acres. The surface is undulating, the soil fertile and well adapted for agriculture. The island offers many attractions as a summer resort. Its permanent population is about 200. A considerable portion is occupied as a military reservation, and here is situated Fort Wright, which forms one of the defenses of the eastern end of Long Island Sound.

FISH FLY. One of a group of large neuropterous insects that pass their early stages in the water and are united into the family Sialidae, of which the alder flies, dobson, and similar forms are also members. The name is more particularly given to the genus *Chauliodes*, which are distinguished from *Corydalis* by the comb-like or feathery feelers and reach a great size. The fish flies lay their eggs upon vegetation overhanging streams, whence the larvæ, as soon as hatched, drop into the water and go about preying upon aquatic animals. "When ready to transform to pupæ," according to Howard, "they crawl out upon the bank and are then found in cavities under stones or even under the bark of trees." See *CORYDALIS*.

FISHGUARD. A seaport and market town in the County of Pembroke, Wales, near the mouth of the river Gwaun, 14 miles north of Haverfordwest (Map: England and Wales, B 5). Its importance is due mainly to commercial possibilities furnished by an excellent harbor, and boats bound for Liverpool stop here to discharge London passengers. There are local fisheries of some value. In 1797 the so-called Fishguard Invasion by the French occasioned great alarm among the inhabitants, but the invaders were quickly repulsed. Pop., 1901, 1739; 1911, 2892.

FISH HAWK. The popular name in North America of the osprey (*Pandion haliaëtus*), of which it is considered a geographical race distinguished as the subspecies *carolinensis*. See *OSPREY*, and Plate of EAGLES and HAWKS.

FISHING. Primeval man hooked and caught fish by the aid of numerous devices, the most important of which were gorges, made of bronze or stone, the latter consisting of pieces of shaped stone about an inch in length with a groove in the middle for the line. One of these gorges, a relic of the Stone age, has been discovered in France and is about 8000 years old. The bait completely covered the gorge, which, when swallowed by the fish, turned across the fish's gullet and held it secure. After stone, bronze was

used and then bone. The early Californian Indians used shell hooks, while the Piute Indians used the spine of a cactus.

Fishing Tackle may be defined as consisting of rod, line, hook, reel, nets, etc. Rods are made of elastic wood and sometimes of steel. Split

PRIMEVAL STONE AND BRONZE GORGES.

bamboo is especially adapted for fly fishing, and lancewood, greenheart, hickory, or ash for any other kind. Double-handed rods for salmon fishing are sometimes over 20 feet in length and weigh nearly three pounds. Most rods are made in sections or joints, so that they can be taken apart and the more easily carried. Fishlines may be of hair, silk, linen, hemp, or cotton, according to the purpose for which they are required. There is a wide variety of hooks, not

ANCIENT FISHHOOKS (BONE).

only for the different fish, but variations in design for the same fish, the choice depending on the skill and preference of the fisherman. Both the straight hook, in which the point is in line with the shaft, and the one in which the point is bent to one side, have their champions. Most hooks are made with flatted, ringed, knobbed, or plain ends. A particularly effective

ANCIENT BRONZE FISHHOOKS,
DOUBLE AND SINGLE.

it twirls and glitters in a manner designed to attract the fish, which, if it snaps at it, is likely to be caught by the hook. This tackle

is used in trolling for bluefish, pickerel, bass, lake trout, and other game fish, although artificial flies, together with a number of hooks, are sometimes attached to the spoon. The *snell* is a piece of silkworm gut connecting the hook and the line. *Sinkers* are generally small pieces of lead, or bullets cut in half, and fastened to the line; *floats* are made of cork or wood and fastened to the line at both ends, serving to indicate to the fisherman the location of his hook and to indicate by their disappearance that a fish has seized the bait. There are many kinds of reels, including the automatic, which winds the line when a spring is pressed. The best tackle in the market and the most experienced fishermen are practically powerless without an effective bait, which ought to consist of some item from the known diet of the fish sought for, or, where that is not obtainable, of something closely resembling it. Beginning with the angleworm or common earthworm, the larvæ of insects, grubs, artificial flies, grasshoppers, etc., the list of available bait may be extended to various kinds of animal and fish flesh, as well as the numerous pastes common with the fishermen of Europe. The only *net* used by the genuine sportsman is the landing net, by which the fish is taken out of the water after it has been brought to shore or boat by the hook and line.

Fresh-Water Fish. The fish most common to amateur fishermen are the various minnows, in many places spoken of as shiners or chubs, of which the most generally known, the dace, is found in New England and the Middle States and demands but an ordinary light rod, with worm or artificial fly for bait. The sunfish or pumpkin seed, perch, bullhead, etc., may be found in ponds or still water throughout the United States, and sometimes in tidal rivers, and are caught with small hooks, with worms as bait, although (excepting the bullhead) they frequently take the artificial fly. In the Southern States good sport may be obtained with artificial flies in the catching of bluefish, blue bream, and copper-nosed bream. A peculiar, though uncertain, method of fishing for the common bream in these waters is to use bait made of brown bread and honey. For all-around sport through most of the year the yellow perch is most popular in the Eastern States. In summer it may be caught with a worm or minnow bait; and in winter holes are cut in the ice, and the white grub, usually found in decayed wood, is used as bait. In the springtime the fly is most attractive. The wall-eyed pike, as the pike perch is sometimes called, is found usually in the Southern States, western New York, the Great Lakes, and Canada, in which latter country it is known as the doree, another fish of the small species being known as the sandre. It is an exceptionally gluttonous fish, easily caught with a hook, and in Lake Champlain is occasionally caught by trolling. The pickerel, or common pickerel, which may be found in all the ponds and streams of the North, East, and Central States, together with the white pickerel of the Ohio and the black pickerel of Pennsylvania, are all distinguished by length of body. The pike seldom grows to be over 3 feet in length, although the maskinonge (like the pike, a member of the pickerel family) has been known in the Michigan lakes and the upper waters of the Mississippi River to be at least 7 feet. The fisherman usually trolls for them with a spoon. The common pickerel weighs on

an average about five pounds. The largest catfish have been known to weigh over 150 pounds, although the flesh of the smaller kinds is the most rich and more generally considered a delicacy.

A fine game fish is the black bass (small or large mouthed), which is plentiful in many lakes and streams east of the Rocky Mountains. It may be caught with minnows, frogs, grasshoppers, etc., or with an artificial fly, or by trolling with a spoon hook. The fishing rods required for this fish are usually about 10 feet long and considerably stouter than those used for trout. The sucker is a fish found in all the fresh waters of the Northern States. It is usually caught with angworm bait, and in the winter, through the ice, it is more easily caught than any other. The carp is a comparatively recent importation from Europe and is now found in many of the Eastern waters (where it frequently becomes a nuisance) as well as in California and Oregon. It haunts muddy waters. The chub is widely distributed in fresh waters and may easily be caught with various baits. The grayling affords exceptionally fine sport. It is generally caught with the fly, but will also bite at worms and insects, and is found along the northern border of the United States. The true salmon is caught chiefly in Canadian rivers as well as in the Penobscot River of Maine. The best time for sport ranges from about the middle of May to the end of July, covering a period when the fish is on its annual pilgrimage from the sea to deposit its spawn or eggs in fresh water. The newly hatched fish are known as pinks, in their second year as smolts, and in their third year as grilse. Artificial flies are the bait commonly used. Trout, second only to salmon in their gameness, are also sea emigrants whenever it is possible for them to be so. They are usually found to best advantage in clear streams and lakes, and angworms, artificial flies, and minnows are used for their capture. In the rivers and lakes of Maine and Canada speckled trout of from four to six pounds are frequently seen, and specimens have been caught weighing nearly 10 pounds. The lake trout is caught by trolling, with a minnow or spoon as bait. Eels are best caught at night, along muddy bottoms; the fresh-water kind are commonly taken on "set lines," and the salt-water variety frequently captured in eel-pot traps.

Salt-Water Fish. The blue perch, nibbler, chogset, salt-water perch, or burgall, names frequently applied to the cunner, is found in great abundance along the coast. It is easily caught with but light tackle and almost any kind of bait, although clam bait seems to have a special attraction for it. The striped bass, or, as it is sometimes called, rock bass, is one of the best game salt-water fishes in the United States. It spawns in tidal rivers and will often make its way up fresh-water streams in its search for food. Its weight ranges from 8 to 75 pounds, and the bait required may consist of anything from a piece of cotton to a small fish. (See BASS.) It is sometimes caught with the artificial fly, and again a line baited with small fish thrown into the surf as in fly casting will be successful. The minnow is the best bait for trolling. It is very strong, very cunning, and very game, making long and fierce runs, severely taxing the skill and strength of the fisherman before it is finally subdued and captured. One of the most common fishes in the

South is the sea chub, frequently called the Lafayette, owing to the fact that it was found in special abundance in 1824, the year of General Lafayette's visit to this country. The fish most common to all the coasts of the United States in the last half of the year is the weakfish, which in the South is occasionally mistaken for the trout. With this fish the clam is the most attractive bait, and the best time for catching is usually during flood tide. It varies in weight from six ounces to over seven pounds, occasional specimens having been caught weighing over 26 pounds. The fish has a large mouth and very soft jaws and is caught with much the same tackle as is used for black bass, the principal requirement being a large hook made of fine steel. Its peculiarity as a food fish lies in the fact that it must be eaten almost immediately after capture or its flesh will become soft. The sheephead, a Southern fish weighing about eight pounds, is an exceptionally hard fish to secure, but is of correspondingly rare delicacy as a food fish and is one much valued by epicures. The scup, known in some parts as the porgy, or paugie, is found more particularly along the Atlantic coast.

Another gamy fish is the bluefish (q.v.), also known as the skopjack, horse mackerel, or (when young) snapper. Bluefish are found anywhere on the American coast between Massachusetts and Brazil. They are best caught with a squid trolled from a sailboat and occasionally from a line thrown out from shore. If they are running in "schools," the fishermen take them in great abundance with their trolling lines. A peculiarity about them is that they keep near the surface and will snap at any living thing in sight. Like the weakfish, they suffer in value for eating purposes if kept very long before cooking. A smaller kind of bluefish is caught along the New England shore with a light tackle and a minnow bait. Along the north coast of New Jersey the smelt is caught in large seines; they spawn under much the same conditions as the salmon. The umbrella tackle used in the State of Maine is a very peculiar as well as effective method of catching the smelt. The umbrella frame is attached to the end of a fish pole, and hanging from the end of each rib is a short line and hook. Mackerel afford excellent sport and may be fished for with hooks baited with small pieces of mackerel flesh or skin, although they are more generally taken in seines. The herring is the most common victim of commercial fishing, but it may also be caught by the individual fisherman in the springtime of the year with an artificial fly as bait. Its near relative, the shad, will also give very excellent sport when fished for with the fly. The king of the herring is the tarpon, which frequents the Gulf of Mexico and the coast of Florida. They vary in weight, but often exceed 150 pounds. They are caught on rod and line as also are the leaping tunas of the Pacific coast, gigantic mackerel, equaling in size and weight the tarpon. The blackfish weighing from two to nine or 10 pounds, and caught by a bait of soft clams, or bits of lobster, with either hand lines or rods, may be found between South Carolina and Massachusetts Bay. In some parts it is known as the tautog (q.v.). Its favorite running places are near sunken wrecks, deserted docks, or where the coast is of rocky formation.

The fish above mentioned are the ones which

may legitimately be classed as game fish; most of the others, usually deep salt-water fish, as cod, haddock, whiting, and halibut, being caught principally for the market and as a means of livelihood. (See FISHERIES.) Sharking (q.v.) is occasionally indulged in off the eastern coast of the United States and sometimes as far north as Nantucket Island. Every State in the Union has its separate fish laws, which, however, are constantly changing in a matter of detail, although their general principles remain the same. Some fish are protected by law from capture by netting, spearing, or any other method except hook and line, and then only during certain months known as the "open season." In some States it is unlawful to take fish under a regulation size or weight, and fines and imprisonments are penalties imposed for the transgression of such laws. In brief, the general trend of the law throughout the United States is to prevent the employment of any method which will destroy the supply. The reader is further referred to ANGLING; BAIT FISHING; FISHING LAWS; FLY CASTING; GAME LAWS; GRAINING; SALMON FISHING; SHARKING; SWORD FISHING; TARPON FISHING; TROLLING; TROUT FISHING.

FISHING BIRDS. Birds subsisting by catching fish and adapted in structure to their capture and digestion. They do not constitute a scientific group, many widely dissimilar forms having taken up and become adapted to this mode of life, not to include such out-of-the-way species as the kingfishers and certain fish-eating birds of prey. The fishing birds proper include the larger sea birds, such as the loons, penguins, auks, puffins, tropic birds, frigate birds, cormorants, and gannets; and certain fresh-water families of higher organization, such as the pelicans, darters, most herons, and some ducks. All are either powerful swimmers and divers, or else are skillful in lying in wait and snatching or piercing any fish that comes sufficiently close to their motionless forms. The instrument (except in the Raptors, which use their talons) is the beak, which is long, straight, sharply pointed, and sharp-edged, so that a firm grip may be had of the slippery bodies of their prey. A large part of the prehistoric birds were fish catchers. Many of the fishing birds have a special provision for bringing home a part of their catch to their young, either by swallowing it as far as the crop, whence it may be disgorged, or by storing it in a bag formed by the distensible membrane between the lower mandibles (e.g., pelicans). Certain more powerful birds (as the jaeger gulls) profit by the labors of the fishing birds, compelling them to give up their prey; and men have trained the cormorant to exercise its skill for their benefit. See CORMORANT; GANNET, and other birds of this group; and Plate of FISHING BIRDS.

FISHING BOUNTIES. It was the policy of the English government to encourage the fisheries, as schools for seamanship, in order that the navy might be readily manned in times of emergency. In the reign of Edward VI we find statutes compelling people to keep the fast days of the old church, although Protestantism had already been introduced. This was to keep up the demand for fish. A statute of Elizabeth went further and removed all import and export duties from fish, and another statute of the same reign encouraged by similar exemption the Iceland trade in herring and cod. In the eighteenth

century this legislation had its desired effect of excluding the Dutch from the fishing trade in England, except in the case of the whale fisheries. To meet the latter difficulty, bounties were offered in 1733 and again in 1740 and 1749 to the owners of vessels engaged in the whale fisheries. These bounties were considerable, amounting in 1755 to £55,000, but they did not have the desired effect of increasing the industry.

Following these precedents and others of Colonial times, the American Congress offered bounties to promote the fishing industry. In 1789 bounties were given for the export of dried, salted, and pickled fish; these were increased in 1797 and 1799. An Act of 1792 offered extensive bounties to vessels engaged in the cod fisheries of Newfoundland. They varied from \$1.50 to \$2.50 on the ton, according to the size of the vessel, three-eighths of which went to the owner and the rest to the fishermen. These bounties were finally abolished in 1854. Consult: *Statutes of the Realm*, 2 and 3 Edw. VI, c. 19, 5 Eliz. c. 5; Cunningham, *Growth of English Industry and Commerce*, i, 443-444; ii, 21-22, 115-116, 282-284 (Cambridge, 1892). For American legislation, consult *United States Statutes at Large*, i, 229 et seq., 260, 533, 692.

FISHING CAT. A species of wild cat (*Felis viverrina*), common in eastern India and through Burma and the Malay Peninsula. It is 30 to 32 inches in length of body, to which must be added 9 to 12 inches of tapering tail. The general color is dark gray, sometimes reddish, striped on the head and neck and spotted elsewhere with dark brown; the throat and breast are white, and the tail barred with chestnut. The peculiarity of this cat is that it subsists mainly upon fish and mollusks of its own catching, but it is said also to be exceedingly fierce and to carry off children. Consult Mivart, *The Cat* (New York, 1892), and Lydekker, *Game Animals of India, Burma, Malaya, and Tibet* (London, 1907).

FISHING CREEK, BATTLE OF. See MILL SPRINGS, BATTLE OF.

FISHING EAGLE. A large eagle (*Polioëtus ichthyæstus*) of India and eastward, which lives by catching fish, having habits and a conformation of claws very similar to those of the osprey.

FISHING FROG. See ANGLER.

FISHING LAWS. Laws regulating the killing or taking of fish. These are divisible into two classes: those which are private, or municipal, in their character and sanction, and those which are international.

Private Fisheries. Some of the rules of municipal law governing fishing rights are fully stated in the article on game laws (q.v.). In Great Britain the right of fishing within the territorial seas and navigable streams belongs *prima facie* to all British subjects. If any person claims an exclusive right in such waters, the burden of proof is upon him to establish that right by royal or parliamentary grant or by prescription. In the United States the same presumption obtains in favor of public fishing in territorial seas and navigable waters, but it is the State and not the national government which ordinarily possesses the power of granting or regulating this right.

English law divides private rights of fishery into three principal classes: (1) common of fishery, or of piscary, (2) free fishery, and (3) several fishery. The first of these is not to be con-

FISHING BIRDS

4. FRIGATE-BIRD (*Fregatus aquila*).
5. OLD-WORLD PELICAN (*Pelicanus onocrotalus*).
6. AFRICAN DARTER (*Platysia levillanti*).

founded with a common fishery, which designates the public right of all comers to take fish in public waters, but is a personal right created by municipal law, in the nature of a profit *à prendre*, to fish in particular waters in common with other persons. The second term is used in two senses. By some writers and judges it is defined as a franchise or exclusive privilege of fishing in a public river, while others make the term synonymous with several fishery. The latter designates the exclusive right which the owner of the soil beneath nonnavigable waters has to fish in those waters. It is a right of property which he may grant to another while reserving to himself ownership of the soil. When so conveyed to and held by another than the power of the soil, it is a profit *à prendre*. See PROFIT *À PRENDRE*.

A private right of fishery is held subject to the public use of navigable water as a highway and for the free passage of fish. It is also subordinate to regulations which may be prescribed by the state for the public good. Regulations of this character are now very numerous both in Great Britain and in the United States. They are intended primarily to prevent the unnecessary destruction of fish and to promote fish culture. They establish close seasons during which fish of certain varieties may not be caught, they regulate the manner of catching them, they prohibit the fouling of streams and ponds, and they annex severe penalties to violations of these provisions.

International Fisheries. International fishing laws are mostly regulated by treaty or convention, and the course of their development has largely depended upon the outcome of political disputes. This is especially true of the fishing laws fixed by treaty between the United States and Great Britain, and between Great Britain and France, in Newfoundland and North American waters. These played so important a part in the history of the three countries during the nineteenth century, and still present so many unsolved problems, that they demand careful consideration.

Between the United States and Great Britain the existing laws represent a working compromise, whose history runs back to 1783. In that year the Treaty of Paris, which acknowledged the independence of the United States, provided that American fishermen should continue to enjoy the right to fish in the waters of the British possessions in America, but forbade them to dry or cure fish on the coast of Newfoundland and in settled bays, harbors, and creeks of Nova Scotia, Magdalen Islands, and Labrador, unless by previous agreement with the inhabitants or possessors thereof. This arrangement continued in force until 1818, although, during the negotiations preceding the Treaty of Ghent of 1814, the views of the American and British commissioners clashed so decidedly on the interpretation of fishing rights under the Treaty of Paris that the question was ignored, as otherwise the Treaty of Ghent might not have been concluded. The superior value of the British-Canadian fisheries had attracted a considerable number of American fishermen, who had established themselves in the most advantageous places for curing and drying fish; and the British government, anticipating the effect of what they considered an undue advantage thus gained, held that the War of 1812 had abrogated the fishing rights fixed by

the Treaty of Paris. By the Convention of London of 1818 the United States renounced for American fishermen the liberty of fishing, subject to certain exceptions, within 3 marine miles of any of the coasts, bays, creeks, or harbors of the British dominions in America, except the right of entering bays or harbors for purposes of shelter and for obtaining wood and water.

During the succeeding 36 years different constructions were put upon these provisions, and from time to time seizures of American fishing vessels were made for trespassing within the 3-mile limit. All these difficulties were, however, removed for a time by the Treaty of Washington (1854), better known as the Reciprocity Treaty, by which mutual restrictions as to sea fisheries, excepting shellfish, were done away with, and each country was granted full enjoyment of the sea-fishing grounds of the other. The termination of this treaty in 1866 by notice of the United States government placed the whole question back again in the position established by the Convention of London, in which it continued until the Treaty of Washington in 1871 restored the mutual fishing privileges of the Reciprocity Treaty. In the Treaty of 1871 provision was made for referring to arbitration the question of the greater value of Canadian fishing waters, and by the Halifax Commission of 1877 an award of \$5,500,000 was made in favor of the Dominion of Canada. This treaty, which went into operation in 1873, was terminated in 1885 according to notice given by the United States government. The extent of the renunciation made by that government as expressed in the Convention of London was again thrown open to opposite interpretations, and, several American fishing vessels having been seized, Congress in 1887 passed a retaliatory law authorizing the President, at his discretion, to close American ports to Canadian vessels and merchandise. The discretion was never exercised. In 1888 another attempt to compose these differences was made by the Chamberlain-Bayard Treaty, which was rejected by the United States Senate; but a *modus vivendi* pending ratification was offered by the British commissioners, and an Act of the Dominion Parliament in 1890 enacted this temporary arrangement into law.

It is noteworthy that the termination of the Reciprocity Treaty of 1854 and of the Washington Treaty of 1871 was due in each case to the action of the United States government; and likewise the proposed Chamberlain-Bayard Treaty, which was acceptable to Great Britain and Canada, was rejected because it was believed wrongly to surrender incontestable American rights. Apart from certain political considerations which compelled American disapproval of these treaties, there were opposite interpretations which arose some years after the Treaty of Paris of 1783, and there were also additional interpretations of treaty rights advanced by the British North American colonies, before and after confederation in 1867. As regards the Treaty of Paris, the American claim, urged by the commissioners during the negotiation of the Treaty of Ghent and on subsequent notable occasions, was that the rights guaranteed by treaty in 1783 were not new, but the continuance of proprietary rights already existing and acknowledged. Not even the restriction as to the 3-mile limit, which is the especial feature of

the Convention of London, is admitted by some American writers; but the terms of that convention are, nevertheless, accepted by both governments as the binding arrangement in default of a treaty superseding them. It has also been contended in behalf of the United States that, by a reciprocal arrangement entered into between that country and Great Britain in 1830, and by Article XXIX of the Treaty of Washington of 1871, American fishing vessels are entitled to the same commercial and transportation rights as other American vessels. Further, it is claimed that the so-called "headland doctrine," which presumes to fix the 3-mile limit by drawing a line from headland to headland instead of following the sinuosities of the coast, and by which American fishermen are prevented from entering Canadian bays and harbors to purchase supplies and transship their catch, was not recognized by Great Britain but was an invention of the Canadian government. It was contended, also, that the stipulations of the Convention of London which allowed the entrance of American vessels into Canadian bays and harbors for repairs, shelter, wood, and water should be deemed privileges accorded on grounds of humanity and not as rights secured by treaty. The opposed contentions of Great Britain and Canada have been urged at various times by their commissioners in treaty negotiations and in the writings and speeches of public men. It is claimed that the American fishing rights guaranteed by the Treaty of Paris of 1783 were abrogated by the War of 1812 and were in consequence ignored by the Treaty of Ghent; that the American renunciation of the liberty of fishing within the 3-mile limit, as set forth in the Convention of London, is definite and final, that American fishing vessels were not within the meaning of the reciprocal arrangement of 1830; that the headland doctrine, and the restriction of the right of American fishing vessels in Canadian bays and harbors to the purposes only of obtaining shelter, repairs, wood, and water, is urgently necessary to protect Canadian fisheries.

Such are the main opposing views. The North Atlantic fisheries since 1885 have been regulated by the Convention of London. Reference has already been made to the temporary arrangement offered by the British Commission pending the ratification of the proposed Chamberlain-Bayard Treaty of 1888 and to the enactment of this arrangement into a Canadian law. An attempt to settle the fisheries question was made by the Joint High Commission, which met in Washington in 1899, but subsequently adjourned indefinitely without settling the various questions proposed.

The fishing laws as between Great Britain and France in Newfoundland waters and the Gulf of St. Lawrence were fixed by the Treaty of Utrecht of 1713, the Treaty of Paris of 1763, the Treaty of Versailles of 1783, the Treaty of Paris of 1814, and the arrangement signed at Paris in 1885. By the first of these treaties Newfoundland was ceded to Great Britain, and the French were allowed to catch fish and dry them on land on that part only of the coast which stretches from Cape Bonavista to the northern part of the island and thence, running down by the western side, reaches as far as Point Riche. By Article V of the Treaty of Paris of 1763, which confirmed French rights on the coast, liberty was given to fish in the Gulf of St. Lawrence at a distance of 3 leagues from the

coast, and on the Cape Breton coast at a distance of 15 leagues, the islands of Saint-Pierre and Miquelon being ceded to France as a shelter to her fishermen. In 1783 the Treaty of Versailles varied the French shore fishing limit, giving up a strip of coast from Cape Bonavista to Cape St. John, but extending the western coast limit to Cape Ray. The Treaty of Paris of 1814 confirmed these rights, and the arrangement of 1885 was entered into chiefly to calm the discontent of the British colonists of the islands, who were harassed on and ejected from the French shore. Article II of that arrangement permitted the formation of establishments on that coast shore for every other industry than fisheries, and stipulated not to disturb resident British subjects between Cape St. John and Cape Ray passing by the north.

The conditions produced by these French rights were seriously detrimental to the interests of the colony, and the Newfoundland Legislature refused to accept the settlements which had been proposed by various conventions. The opposing claims of the colonists and the French fishermen were clearly defined. The colonists contended that French rights under the Treaty of Utrecht did not forbid them to fish between Cape St. John and Cape Ray so long as they did not interrupt French fishing; that the French fishermen exceeded their rights in catching and canning lobsters; that colonial settlements and enterprises, other than fixed fishing establishments, were hindered, and also the working of mines; and that portions of the coast on which the French renounced their rights were worthless. The French fishermen contended, on the other hand, that their rights under the treaties were exclusive, and that all British fixed settlements between Cape St. John and Cape Ray were illegal.

By the Anglo-French *entente* of 1904 most of the questions at issue were definitely settled. France surrendered her pretensions to exclusive rights under the existing treaties, as also the right of French fishermen to cure fish on the coast of Newfoundland. In return for these concessions England paid France a money indemnity. The right to fish in common with British subjects, where this was formerly permitted, is retained by the French fishermen and continues to be a source of friction.

See GAME LAWS; FERÆ NATURÆ. For a discussion of the seal fisheries in Bering Sea, see BERING SEA CONTROVERSY.

FISH-KILLER. One of the great aquatic bugs of the heteropterous family Belostomatidae, which prey upon fishes. They are the largest of existing bugs, some reaching a length of 4 inches, and have an oval outline, flat body, and a brownish or grayish hue. Their legs are flattened into powerful swimming organs, except the foremost pair, which are incurved and form organs for seizing and holding their victims, aided by hooks and processes on the inner surface of the tibiae. The mouth parts include a strong beak for stabbing the prey, from which all the blood is sucked before it is let go. At the end of the abdomen are two narrow, flat-

tened appendages, which are extensive but not concerned in respiration. The family is numerously represented in the rivers and ponds of

FISHKILLER.

northern Africa and southern Asia, but most extensively in America. The largest-known species is *Belostoma grandis* of the Amazonian region, where it lurks on the muddy bottoms of sluggish streams and bayous, ready to seize any salamander, fish, or other aquatic animal that it can overcome. The two most abundant and largest species in the United States are *Belostoma americana* and

Benacus griseus, which much resemble one another in the brown-gray color and shape, but may be distinguished by the fact that the *Belostoma* "has a double groove on the underside of its fore thighs which is lacking on the thighs of *Benacus*." These bugs swarm about electric street lights in such numbers as to be known in many places, of late, as "electric-light bugs." They breed and develop wholly in the water, but their life history is not well known. The females of a related genus, *Zaitia*, have been found to have the curious habit of depositing and fastening their eggs upon the back of the males, who unwillingly carry them about until they hatch. The males fight hard against the infliction of this indignity, but are actually overcome by the females. Great damage may follow the introduction of these bugs into fish-cultural establishments. Consult Summers, "The True Bugs, or Heteroptera, of Tennessee," in *Tennessee Agricultural Experiment Station Bulletin*, vol. iv, No. 3 (Nashville, 1891).

FISH-KILL LANDING. Formerly a village in Dutchess Co., N. Y., 59 miles north of New York City, on the east bank of the Hudson River, opposite Newburg, with which it is connected by a steam ferry, and on the Central New England and the New York, New Haven, and Hartford railroads (Map: New York, B 1). In May, 1913, it was joined with Matteawan village, forming the new city of Beacon, which was the first in the State to adopt the commission form of government. Its population as the village of Fishkill Landing, before the union with Matteawan, was, 1900, 3673; 1910, 3902. It has a picturesque location, contains a hospital, public library, and the Caswell Academy, and, as one of the oldest villages in the State, is replete with historical interest. There are several brick plants, and manufactories of hats, paints, tools, bakers' machinery, rubber and leather goods, carriages and sleighs, etc. Fishkill Landing was settled probably about 1695 and incorporated as a village in 1866. In 1776 the Provincial Convention of New York met here, and from 1776 to the close of the Revolution Fishkill was one of the principal military depots of the Northern army. At the Verplanck homestead, in the environs of the village, the Society of the Cincinnati was organized in 1783. Consult: Smith, *History of Dutchess County* (Pawling, N. Y., 1877); an article, "Fishkill in the Revolution," in the *Publications of the Historical Society of Newburg Bay*, for 1894; and Verplanck, "The Birthplace of

the Order of the Cincinnati," in *New England Magazine*, vol. xiv, No. 5 (Boston, 1896).

FISH LOUSE, or SEA LOUSE. Any of various small crustaceans (copepods) which live parasitically on the outside or in the branchial chambers of marine animals, especially fishes and whales. All are of small size, and attached either temporarily or permanently to the hosts, on the juices of which they live, although many species have also the power of swimming freely in the water, some of their legs being adapted to this purpose. They are animals of singular form and appearance. In the genus *Argulus* there is a curious sucking disk on each side of the beak, or proboscis, although there are also jointed members terminated by prehensile hooks. In the genus *Caligus* the hooks of the anterior pairs of feet are the principal organs of adhesion to the slippery bodies of the fishes from which food is to be drawn, and the abdomen of the female is furnished with two remarkably long tubes, which contain a long series of flattened, coin-shaped eggs. The bodies of all of them are transparent, or nearly so. Consult United States Fish Commission *Annual Reports* (Washington, 1871 et seq.) for particulars as to the extensive list of species catalogued in American waters. See COPEPODA; also cut in article MENHADEN.

FISH MANURE. Dried and ground fish, or fish guano, is a valuable fertilizer obtained mainly from two sources: (1) the refuse from fish packing and canning establishments, and (2) the pomace from the extraction of oil from fish—in America, chiefly the menhaden. The product from the latter source is especially rich in fertilizing constituents, containing from 7 to 8 per cent of nitrogen and 6 to 8 per cent of phosphoric acid. The availability of the nitrogen is nearly as great as that of dried blood and tankage. The phosphoric acid is frequently more available than that in other organic matter. The availability of the fertilizing constituents depends largely upon the proportion of oil present. A considerable proportion of the latter delays decomposition in the soil and thus reduces the availability. The oil is removed and the fish prepared for use as a fertilizer on a commercial scale by cooking with steam and pressing. The pressed residue is dried and ground. In some cases, after the first pressing, the material is subjected to the action of steam under pressure and sulphuric acid (5 per cent) to render the fertilizing constituents more available. The uncooked fish is sometimes treated directly with sulphuric acid to prevent offensive decomposition and to increase the availability of the nitrogen and phosphoric acid.

Fish manures are prepared and used in considerable quantities, especially along the northeastern coast of America, in Norway, and other regions where the supply of material is abundant. Their preparation has greatly increased in recent years on the northwest coast of the United States and in Alaska, largely for export to Hawaii and Japan. Fish manure is exported in considerable quantities from Norway. There is still, however, enormous waste of fish by-products which might be profitably utilized as fertilizers.

In localities where it can be readily obtained from fishermen, fish scrap is frequently used without preparation of any kind. Naturally this product is very variable in composition, the nitrogen ranging from 2.5 to 8 per cent and

the phosphoric acid from 2 to 6 per cent. The fertilizing constituents of this material are less available than those of the dried and finely ground fish. The whole fish are also sometimes used as a manure, either directly or composted with other materials. It is stated in Bradford, *History of Plymouth Plantation* (Boston, 1856), that the Indian Squanto first taught the New England colonists to use the menhaden as a fertilizer for corn, instructing them to put the fish under the hills at the time of planting. (See also MANURES AND MANURING.) Consult: Goode, "The Natural and Economic History of the American Menhaden," *United States Fish Commission Report* (1877); Stevenson, "Aquatic Products in Arts and Industries," *United States Fish Commission Report*, p. 177 (1902); Voorhees, *Fertilizers* (New York, 1902); Aikman, *Manures and the Principles of Manuring* (Edinburgh, 1894); Storer, *Agriculture* (7th ed., New York, 1897); Turrentine, "The Fish-Scrap Fertilizer Industry of the Atlantic Coast," *United States Department of Agriculture, Bulletin 2; American Fertilizer Handbook* (Philadelphia, 1913).

FISH OF PARADISE. An East Indian fish (*Macropodus viridicinctus*), related to the gouramis and noted for its extended fins and brilliant colors. It is cultivated for ornamental aquariums.

FISH OWL. See KETUPA.

FISHPLATE. See RAILWAYS.

FISH SKIN DISEASE. See ICHTHYOSIS.

FISHTAIL PALM. See CARYOTA.

FISK, CLINTON BOWEN (1828-90). An American soldier and philanthropist. He was born at Greigsville, N. Y., spent some years as a merchant in Michigan, and then removed to St. Louis, Mo. At the beginning of the Civil War he entered the Union army and in 1865 was brevetted major general. Subsequently he devoted his life largely to the interests of the negro race, was assistant commissioner in the Freedmen's Bureau, and was instrumental in founding Fisk University. In 1884 he left the Republican party and identified himself with the temperance movement. He was Prohibition candidate for Governor of New Jersey in 1886 and for President of the United States in 1888. Consult the *Life* by A. A. Hopkins (New York, 1888).

FISK, FIDELIA (1816-64). An American missionary. She was born in Shelburne, Mass., graduated from Mount Holyoke, was a missionary of the American Board among the Nestorians in 1843-58, and became first principal of the seminary for women at Urumiah. She wrote *Recollections of Mary Lyon* (1866). Consult D. T. Fiske, *A Memoir of Fidelity Fisk: Faith Working by Love* (Boston, 1869).

FISK, JAMES, JR. (1834-72). An American stock manipulator and financial buccaneer. He was born in Bennington, Vt., the son of a peddler, and received scanty schooling. After trying various other occupations, he took up that of his father and finally attracted the attention of Jordan and Marsh, the Boston merchants of whom he bought his wares, and as a member of that firm enriched them and himself by shrewd bargaining with the government and, it was said, by smuggling cotton through the lines during the Civil War. Four years later he opened a brokerage office in New York City. He picked up a precarious living for some time,

until Daniel Drew set him up in business with a man named Belden, using them as his agents in his famous struggle with Cornelius Vanderbilt for the control of the Erie Railway. As a result of a compromise, the Drew-Fisk interest combined with the Eldridge-Gould interest, forced the Vanderbilt faction out of the directorate, installing Fisk and Jay Gould in their stead. This marked the beginning of the notorious association of Jay Gould and James Fisk, which terminated only with the death of Fisk. Gould became president of the Erie Railroad, and Fisk the vice president and controller. From their headquarters a campaign of bribery and corruption was carried on that brought under the power of these men city, State, and Federal officials, judges and legislatures, reaching its climax in the gold conspiracy of 1869 and "Black Friday," when an attempt was made to control President Grant himself. In a quarrel with one of his former partners, E. S. Stokes, three years later, Fisk was shot and killed. Consult Adams, *Chapters of Erie, and Other Essays* (New York, 1886), and Black, *Essays* (ib., 1890).

FISK, PLINY (1792-1825). An American Congregational missionary, born in Shelburne, Mass. He graduated at Middlebury College, Vermont, in 1814 and at Andover Seminary in 1818. After being agent of the American Board of Commissioners for Foreign Missions he went to Palestine in 1819 and in 1825 became a member of the successful mission in Beirut. After his death was published an English-Arabic Dictionary which he finished the day he died. Consult Bond, *Life of Pliny Fisk* (Boston, 1828).

FISK, WILBUR (1792-1839). An American educator and clergyman. He was born at Brattleboro, Vt., graduated at Brown University, and afterward studied law, but in 1818 entered the Methodist ministry. With others, he founded an academy at Wilbraham, Mass., of which, in 1825, he became the first principal. He also aided in the founding of Wesleyan University, at Middletown, Conn., and became its first president in 1831. He had previously refused the presidency of La Grange College (Alabama), and in 1836 declined an election as Bishop in the Methodist Episcopal church. Among his works are: *The Science of Education* (1832); *The Calvinistic Controversy* (1837); *Travels in Europe* (1838). Consult Joseph Holdich's biography in *American Religious Leaders Series* (New York, 1842), and George Prentice in *Life and Writings of Wilbur Fisk* (Boston, 1890).

FISKE, AMOS KIDDER (1842-). An American journalist and author, born at Whitefield, N. H. He graduated at Harvard in 1866, was admitted to the New York bar in 1868, assisted G. T. Curtis (q.v.) in the preparation of the latter's *Life of Daniel Webster* (2 vols., 1870), contributed to the revised edition of the *American Cyclopaedia* of Ripley and Dana (1873-76), and for 22 years was connected with the editorial staff of the *New York Times*. In 1900-02 he was a member of the staff of the *New York Mail and Express*, and in 1903 he became associate editor of the *New York Journal of Commerce and Commercial Bulletin*. His publications include: *Midnight Talks at the Club* (1890); *Beyond the Bourn* (1891); *The Jewish Scriptures* (1896); *The Myths of Israel* (1897); *The Story of the Philippines* (1898); *The West Indies* (in the "Story of the Nations

Series," 1899); *The Modern Bank* (1904); *The Great Epic of Israel* (1911).

FISKE, BRADLEY ALLEN (1854-). An American naval officer and inventor. He was born at Lyons, N. Y., and graduated from the United States Naval Academy in 1874. Rising through the various grades, he became captain in 1907 and rear admiral in 1911. At the battle of Manila Bay he was navigator of the *Petrel* and during the Filipino insurrection, while navigator of the *Monadnock* and executive officer of the *Yorktown*, he participated in several bombardments. He was in command, at various times, of the *Minneapolis*, the *Arkansas*, the *Tennessee*, and the fifth division of the Atlantic fleet, and in 1911-12 was president of the Naval Institute. His inventions include a large number and variety of electric devices for warships. His naval telescope sight resulted in greatly improving the accuracy of naval gunnery. He was awarded the Elliott Cresson gold medal by the Franklin Institute (1893) and a gold medal by the United States Naval Institute (1905) for the prize essay "American Naval Policy." Besides special articles, he is author of *Electricity in Theory and Practice* (1883) and *War Time in Manila* (1913).

FISKE, DANIEL WILLARD (1831-1904). An American scholar, born in Ellisburg, Jefferson Co., N. Y. He was educated at Hamilton College, but left before graduating to go abroad and devote his time to a study of the Scandinavian language and literature. He spent the years 1849-52 at the University of Upsala, supporting himself by teaching English and lecturing on American literature. From 1852 to 1859 he was an assistant in the Astor Library, New York City, and devoted much of his attention to gathering its Scandinavian collection. He edited the *American Chess Monthly* (1857-60) and published *The Book of the American Chess Congress* (1859). In 1861-62 he was an attaché of the American Legation at Vienna, under John Lothrop Motley. He was editor of the *Syracuse (N. Y.) Daily Journal* in 1864-66, and of the *Hartford (Conn.) Courant* in 1867-68. In the latter year he was elected professor of North European languages and librarian at Cornell University. In 1881 he resigned, and removed to Florence, Italy. He presented to Cornell a very valuable Dante collection, for the catalogue of which he wrote a noteworthy introduction. His posthumous publications include: *Bibliographical Notices* (6 vols., 1886-1907); *Chess in Iceland and in Icelandic Literature* (1905); *Chess Tales and Chess Miscellanies* (1912).

FISKE, HARRISON GREY (1861-). An American theatrical manager and journalist. He was born at Harrison, N. Y., was educated at New York University, and early served as an editorial writer and dramatic critic for the *Jersey City Argus* and later for the *New York Star*. In 1879 he became a contributor to the *New York Dramatic Mirror*, of which, until 1911, he was editor (and after 1883 proprietor). He was also manager for the Manhattan Company and for his wife, Minnie Maddern Fiske, and other stars. He wrote the plays *Hester Crewe*, *The Privateer*, and *A White Pink*.

FISKE, JOHN (1842-1901). An American philosopher and historian. His original name was Edmund Fiske Green, but on the second marriage of his mother (1855) he assumed the name of his maternal great-grandfather, John Fiske. He was born at Hartford, Conn., March

30, 1842. As a child, he exhibited remarkable precocity. He was graduated at Harvard College in 1863 and at the Harvard Law School in 1865; but he never practiced law, having already, in 1861, inaugurated his literary career by an article on Mr. Buckle's fallacies, in the *National Quarterly Review*. In 1869 he began a career of distinguished success as a lecturer at Harvard, his general subject being "Philosophy in its Evolutionary Aspect." In 1870 he was made instructor in history there, and in 1872 assistant librarian, a post which he resigned in 1879. In 1884 he was made professor of American history in Washington University, St. Louis, having held a lectureship there since 1881, and lectured annually for some years, though continuing to reside in Cambridge. His reputation was already international, for he had lectured on American history at University College, London, in 1879, and at the Royal Institution of Great Britain in 1880. During the earlier part of his career his interest was very largely absorbed by the study of evolution, and it was as a popularizer of its philosophy that he first won a national reputation, through *Outlines of Cosmic Philosophy* (1874). Essays and studies on allied subjects appeared under the titles: *Myths and Myth Makers* (1872); *The Unseen World* (1876); *Darwinism and Other Essays* (1879; revised and enlarged, 1885); *Excursions of an Evolutionist* (1883); *The Destiny of Man Viewed in the Light of his Origin* (1884); *The Idea of God as Affected by Modern Knowledge* (1885). This last work, supplemented by his *Origin of Evil* (1899), may be regarded as a final epitome of his religious and philosophic views. In addition to the volumes named may be mentioned: *A Century of Science and Other Essays* (1899); *Through Nature to God* (1899); *Life Everlasting* (1901). *American Political Ideas Viewed from the Standpoint of Universal History* was published in 1885, and with this began the 15 years devoted to investigations in American history, which must be regarded as at once the most popular and the most valuable of his contributions to American literature and to the molding of the national life. His contributions in book form to the history of his country were: *The Critical Period of American History, 1783-89* (1888); *The Beginnings of New England* (1889); *The War of Independence*, a book for young people (1889); *Civil Government of the United States* (1890); *The American Revolution* (2 vols., 1891); *The Discovery of America* (2 vols., 1892); *A United States History for Schools* (1895); *Old Virginia and her Neighbors* (2 vols., 1897); *Dutch and Quaker Colonies in America* (2 vols., 1899); *Essays, Literary and Historical* (1902); *New France and New England* (1902). In 1912 the *Historical Works* (Popular Edition) appeared, a collection of Fiske's historical writings in 11 vols. These various works may be said to constitute practically a connected history of the United States from the first discoveries to the establishment of federal government. In 1900 appeared *The Mississippi Valley in the Civil War*. In addition, he edited, with Gen. James Grant Wilson, *Appleton's Cyclopædia of American Biography* (1887). He is to be esteemed not less as an educative force than as an investigator. More than any other writer of his generation he brought home to the national consciousness a philosophic view of American history, by his remarkable power for lucid statement of bal-

anced judgments. To his zeal of acquisition was joined an equal zeal to impart, and his admirable style made the work of following him anything but labor. He died, worn out by overwork, at Gloucester, Mass., July 4, 1901. Consult Perry, *John Fiske* (Boston, 1906).

FISKE, LEWIS RANSOM (1825-1901). An American Methodist Episcopal clergyman, born in Penfield, N. Y. He graduated from the University of Michigan in 1850. Entering the ministry in 1857, he served several important churches, and was president of Albion College from 1877 to 1897. He was president of the Association of College Presidents of the Methodist Episcopal church, a member of six general conferences and of the ecumenical conference of 1891, and in 1889 president of the Michigan Teachers' Association. His baccalaureate sermons were published in 1898.

FISKE, MINNIE MADDERN (1865-). A prominent American actress, born in New Orleans, of theatrical parents, her father, Thomas Davey, being a manager. Maddern was her mother's family name. From infancy her life was largely spent in the theatre, and at three years she made her regular appearance upon the stage. Throughout her childhood she played at times with many well-known actors, including Laura Keane, John McCullough, and, later, Barry Sullivan and E. L. Davenport. Occasionally she even took old women's parts and at 13 appeared as the Widow Melnotte with great success. When 16 years old Miss Maddern was brought out as a star (May, 1882, in *Fogg's Ferry*), and thus for several years she won some success; but her rôles were not, on the whole, well suited to her. In March, 1890, she was married to Harrison Grey Fiske and retired for over three years of rest and study. In the fall of 1893 she reappeared in New York in her husband's *Hester Crewe*; she played also the part of Nora in Ibsen's *A Doll's House* and later for some time resumed her Western tours. In 1897 she made a sensation in *Tess of the D'Urbervilles*. Afterward she appeared in *A Bit of Old Chelsea*, *Little Italy*, *Frou Frou*, *Magda*, and other plays, of which her *Becky Sharp* (1899) is considered her greatest achievement. In the season of 1901-02 she opened the Manhattan Theatre as an independent New York playhouse, where she produced *The Unwelcome Mrs. Hatch* and in 1904 *Leah Kleschna*. From 1907 to 1910 she brought out Ibsen's *Rosmersholm* and *The Pillars of Society* and Hauptmann's *Hanneles Himmelfahrt*, appearing in the leading parts. Mrs. Fiske is an actress of strong intelligence and no little power of dramatic realism, with an insistent quality which is capable of great effect in passages of sustained emotion. She is the author of several plays and collaborated with her husband in *Fontenelle*. Consult: Strang, *Famous Actresses of the Day in America* (Boston, 1899); McKay and Wingate, *Famous American Actors of To-Day* (New York, 1896); Hapgood, *The Stage in America, 1897-1900* (ib., 1901); Winter, *The Wallet of Time* (2 vols., ib., 1913).

FISKE, STEPHEN (1840-). An American journalist and dramatic critic, born at New Brunswick, N. J. He was educated at Rutgers College and served on the New York *Herald* in various capacities—as correspondent during part of the Civil War and on the Prince of Wales's (Edward VII's) tour of the United States, as editorial writer, and as dramatic

critic. For a time he managed the St. James's Theatre and the Royal Opera, London, and the Fifth Avenue Theatre, New York, and it was he who first introduced Modjeska and Mary Anderson. He was later appointed dramatic critic of the *Spirit of the Times*, New York City. His writings comprise several plays, including an adaptation of Dickens's *Martin Chuzzlewit*, *Holiday Tales*, and two collections of sketches, *English Photographs* and *Offhand Portraits of Prominent New Yorkers* (1884), the latter containing much interesting material originally published in the *Knickerbocker Magazine*.

FISKE, THOMAS SCOTT (1865-). An American mathematician. He was born in New York City and graduated in 1885 (Ph.D., 1888) from Columbia University, where he was fellow, assistant, tutor, instructor, and adjunct professor until 1897, when he became professor of mathematics. In 1899 he was acting dean of Barnard College. He was president in 1902-04 of the American Mathematical Society, and he also edited the *Bulletin* (1891-99) and *Transactions* (1899-1905) of this society. In 1902 he became secretary of the College Entrance Examination Board. In 1905-06 he also served as president of the Association of Teachers of Mathematics of the Middle States and Maryland. Besides his mathematical papers, he is author of *Theory of Functions of a Complex Variable* (1906; 4th ed., 1907).

FISK UNIVERSITY. An institution for the education of colored persons, founded in 1866, at Nashville, Tenn., by the American Missionary Association of New York and the Western Freedmen's Aid Commission of Cincinnati. The university early became well known through the efforts made on its behalf by Gen. Clinton B. Fisk, from whom the institution took its name, and from the "jubilee singers," composed of its students, who toured the United States and Great Britain, raising \$150,000 for the institution's needs. The university at present comprises normal, college, preparatory, music, and industrial departments. The attendance in all departments in 1913 was 514, of whom 206 were in the collegiate department. The total value of the university property was about \$350,000, and the annual income from endowment and tuitions about \$6000. It has had three presidents, E. M. Cravath, D.D., J. G. Merrill, D.D., and G. A. Gates, D.D., LL.D. C. W. Morrow, D.D., was in 1914 the dean and acting president.

FISSION, fish'ün (Lat. *fissio*, from *findere*, to split; connected with Skt. *bhid*, to split, Goth. *beitan*, OHG. *bizzan*, Ger. *beissen*, AS. *bītan*, Eng. *bite*). In plants, a term which has been applied to cell division in general, but which is now becoming restricted to cell division in the bacteria and blue-green algae (Cyanophycæ) and to the splitting of chromosomes. (See CELL, in plants.) In animals of lowest organization, the process of reproduction by "budding" or cell division.

FISSION FUNGI. See SCHIZOMYCETES.

FISSIPEDIA. See CARNIVORA.

FIS'TULA (Lat., pipe). A term formerly applied to such an abscess (q.v.) as had contracted to narrow, hard, open passages in the soft tissues of the body, lined by a kind of false membrane, giving rise to a thin discharge. At the present time the term "fistula" is generally limited to the opening of such a passage when in close contact with a mucous membrane,

the word "sinus" being used in the former sense. Thus, it is common to speak of salivary fistulæ, urinary fistulæ, etc.; and the most common and troublesome kind of all is the *fistula in ano*, in connection with the lower bowel or rectum. It consists essentially of an unhealed abscess, discharging by two openings—one in the mucous membrane, the other in the skin. When only one opening exists, the fistula is known as a blind one. The only efficient treatment is surgical and consists in laying open the tissues to the bottom of the cavity.

Fistulous openings may form between the bladder, the urethra, the rectum, the ureter, and the vagina. The latter, vesicovaginal fistula, is most common, and is usually the result of injuries sustained in difficult labors. Leakage of urine occurs with the distressing accompaniments of inflammation, sloughing, and sometimes secondary infection of the kidneys. The condition is curable by a plastic operation. J. Marion Sims, an American surgeon, was the first to perform the operation in the United States.

In farriery, the name is given to a pus-discharging abscess usually situated on the withers of a horse. When it appears on the head, it is called poll evil. Such abscesses are usually due to chafing halter, harness, or saddle, or to blows. Horses with high withers, or saddle horses with low withers upon which the saddle rides far forward, are especially liable to this affection. The most satisfactory treatment is to open the abscess at its lowest point, so as to allow for drainage, and to wash out with antiseptic solutions.

FISTULINA. See FUNGI, EDIBLE AND POISONOUS.

FIT (AS. *fitt*, struggle, of unknown etymology). A name popularly applied to a convulsion (q.v.), or, indeed, to any sudden seizure of disease implying loss of consciousness. (See HYSTERIA; EPILEPSY.) The term is also used colloquially to designate a mood or a temporary change in mental attitude, without disease, as denoted by such expressions as "a fit of the blues," "a fit of abstraction," "an economical fit," etc.

FITCH, or **FITCHEW**, *fich'û* (from ODutch *vitsche, visse, fisse, polecat*). The European polecat (q.v.).

FITCH, CLYDE. See FITCH, WILLIAM CLYDE.

FITCH, EBENEZER (1756-1833). An American educator, born in Norwich, Conn. He graduated at Yale in 1777 and in 1780-83 and 1786-91 was tutor there. In 1791 he became principal of the school at Williamstown, Mass., and when it became Williams College in 1793 he was elected its first president. This position he resigned in 1815, to become pastor of the Presbyterian Church at Bloomfield, N. Y. He retired to private life in 1827. He was the author of a *Latin Grammar* (1814).

FITCH, GRAHAM NEWELL (1809-92). An American legislator, born in Le Roy, N. Y. He studied medicine, and removed to Logansport, Ind., in 1834. From 1844 to 1849 he was a professor in Rush Medical College, Chicago, and from 1878 to 1883 in the Indiana Medical College. From 1836 to 1839 he was a member of the State Legislature and from 1849 to 1853 was in Congress. In 1857 he was elected to the United States Senate and served until 1861. In the fall of that year he was commissioned colonel of the Forty-sixth Indiana Volunteer Infantry, which he had himself raised. Late in 1862 he

was compelled to resign, as a result of wounds received in action.

FITCH, JOHN (1743-98). A distinguished American inventor, who was one of the first to apply steam to the propulsion of boats. He was born at Windsor, Conn., and was the son of a farmer. After receiving a common-school education he made a few voyages before the mast, and at the time of the Revolution he became a sutler with the American army and amassed extensive profits, which he invested in Virginia. In 1780 Fitch became deputy surveyor of Kentucky and a year later, while traveling, was captured by the Indians, but soon released. He next devoted himself to the production of a map of the Northwestern country, and the idea of employing steam in the navigation of the Western rivers, on which he sailed, having occurred to him, he sought by the sale of this map to obtain the means for his experiments. Unsuccessful in this, he next sought help from the State legislatures, but failed to obtain an appropriation. He at last succeeded in forming a company and, with the assistance thus obtained, constructed a steam packet, which was launched on the Delaware in 1787 and reached a speed of 3 miles an hour. This boat was fitted with paddles at the sides, which were moved forward and back in a manner similar to that followed in propelling a canoe. A second boat had similar paddles at the stern. Fitch had obtained exclusive rights of steam navigation in New Jersey, Pennsylvania, and Delaware, and in 1790 built a boat to convey passengers on the Delaware River for hire. The scheme proved unfortunate, and the company which sustained him was dissolved. In 1793 he went to France, with the hope of introducing his invention, but failed, and returned to America disheartened and impoverished. In 1796 he constructed a small screw steamboat, with which he experimented on the "Collect" Pond in New York City. In the meantime his Virginia lands had fallen a prey to "squatters," and, heartbroken by his failures and disappointments, he committed suicide. Consult Westcott, *Life of John Fitch* (1857), and, for a brief account of his work, Thurston, *Growth of the Steam Engine* (New York, 1878).

FITCH, SIR JOSHUA GIBLING (1824-1903). An English educator, born in London. Graduating from the University of London in 1850 (M.A., 1852), he joined the staff of the Borough Road Training College, of which in 1856 he became principal. In 1863 he was appointed inspector of schools, in 1883 he became chief inspector for the eastern division, and from 1885 to 1894 he was chief inspector of training colleges for women in England and Wales. He was also assistant commissioner for the schools inquiry commission in 1865-67 and for the endowed schools in 1870-77. He was knighted in 1896. His publications include: *Lectures on Teaching* (1881); *Thomas and Matthew Arnold, and their Influence on English Education* (1897); *Educational Aims and Methods* (1900).

FITCH, LEROY (1835-75). An American naval officer, born in Indiana. He graduated in 1856 at the United States Naval Academy, served during the Civil War in the Mississippi squadron, and rose in 1870 to be commander. He participated in the capture of Fort Donelson and Fort Pillow, and in 1863, while commanding the *Moose*, he prevented Morgan's attempted crossing of the Ohio River and captured the wagon train and part of the artillery of that

leader. Subsequently he directed the defense of Johnsonville, Tenn., against Gen. N. B. Forrest.

FITCH, RALPH. An English merchant and traveler of the sixteenth century. Nothing is known of his birth or early life. In 1583, with John Newberry and two other Englishmen in the service of the Levant Company, he set out on a commercial journey to the Far East, his object being mainly to return with a supply of Eastern spices and other commodities. The party traveled from Aleppo, in Syria, down the valley of the Euphrates to Basra, at the head of the Persian Gulf, being the first Englishmen known to have made the overland trip. Continuing their journey to Ormuz, they were there imprisoned by the Portuguese Governor. From Ormuz they were conveyed as prisoners to Goa. After some months spent in captivity, the prisoners were released, and Fitch and two companions started overland across India. The party intended traveling as far as China, but it is believed that Portuguese trade rivalry prevented them from attaining their goal. Fitch ultimately parted company with his companions, and, after spending some time in the valley of the Ganges, took ship to Pegu, near Rangoon, in Burma, which country he was the first Englishman to visit. From Pegu he traveled through Siam and visited Malacca and Singapore, returning thence to Pegu, Bengal, and, by way of the Malabar coast, to Goa, whence he returned to Europe by the same route over which he had come, and arrived in England in 1591, after an absence of eight years. He continued in mercantile business and was probably one of the promoters of the East India Company. His account of his journey has been printed in Hakluyt's *Voyages* and in Pinkerton's *Collections of Travels* (London, 1812-14).

FITCH, (WILLIAM) CLYDE (1865-1909). An American playwright, born in New York and educated at Amherst College, where he graduated in 1886. His first play, *Beau Brummel*, was brought out by Richard Mansfield in 1890. This was followed by several adaptations from the French and German and a large number of original pieces. He quickly sprang into prominence and was the first American dramatist whose name was sufficiently well known to attract people to the theatre. His work often suffered from carelessness and haste, but it has about it an unmistakable mark of distinction. His best-known plays are: *Nathan Hale* (1898); *Barbara Frietchie* (1899); *The Climbers* (1905); *The Stubbornness of Geraldine* (1902); *The Girl with the Green Eyes* (1902); *Her Own Way* (1903); *The Woman in the Case* (1904); *The Truth* (1906); *The Straight Road* (1906); *The City* (1909). The last was unfinished when his sudden death occurred in 1909, but was produced in the form in which he left it. Consult Montrose J. Moses, *The American Dramatist* (Boston, 1911), and William Winter, *The Wallet of Time* (2 vols., New York, 1913).

FITCHBURG. A manufacturing city (including the villages of West Fitchburg, South Fitchburg, and Cleghorn) and one of the county seats of Worcester Co., Mass., 42 miles by rail north of Worcester and 50 miles west-northwest of Boston, on a branch of the Nashua River and on the Boston and Maine and the New York, New Haven, and Hartford railroads (Map: Massachusetts, D 2). It is the seat of the Fitchburg State Normal School and has a public library, large musical library, Burbank Hos-

pital, three parks, an old ladies' home, a home for working women, and a children's home. Fitchburg has extensive manufactures of textiles, firearms, saws, screen plates, and steel horse collars. In 1912 the value of its products exceeded \$32,000,000. Other of its industrial interests include granite quarries, brickyards, and manufactures of axle grease, boilers, lining metals, castings, turned-wood novelties, pumps, cotton yarns and woolsens, gingham, cars, bicycles, steam engines, electrical appliances, paper, machinery, tools, etc. Fitchburg was settled in 1719, but formed a part of Lunenburg until 1764, when it was incorporated. It was chartered as a city in 1872. The government is administered, under the original city charter, by an annually elected mayor. Fitchburg owns its water works. Pop., 1900, 31,531; 1910, 37,826; 1914 (U. S. est.), 40,507. Consult Torrey, *History of the Town of Fitchburg* (Fitchburg, 1865), and *History of Worcester County* (Philadelphia, 1889).

FITCHY, or FITCHEE (from Fr. *fiché*, p.p. of *ficher*, to drive in, It. *ficcare*, to fix, from Lat. *figere*, to fix, to fasten). A term in heraldry signifying "pointed" and usually applied to a cross the lower arm of which has been sharpened so that it may be fixed in the ground. This form is derived from the crosses carried by pilgrims as walking sticks. See **HERALDRY**.

FITGER, or FITGER, ARTHUR HEINRICH WILHELM (1840-1909). A German poet and historical painter, born at Delmenhorst (Oldenburg). He was a pupil of Cornelius and Genelli at the Munich Academy; later he studied at Antwerp, Paris, and Rome, and in 1869 established his studio in Bremen. As a painter, he is known for his large decorative works. The motif of these is derived mostly from the legendary or the purely fantastic, and elaborated with a wealth of coloring acquired from Rubens and the Venetians. They include a frieze (in monochrome), representing the development of German civilization, for the Rutenhof, Bremen; the frieze for the gallery of the Bourse and decorations for the Ratskeller, both at Bremen; 14 pictures for the banquet hall of the ducal residence at Altenstein, Saxe-Meiningen; "The Four Elements" for the Kunsthalle of Hamburg; the decorations for the *salle des fêtes* of the Bremen Künstlerhaus; and paintings for the Hamburg Town Hall and for the North German Lloyd steamer *Kaiser Wilhelm I.* His publications include: *Adalbert von Bremen*, a tragedy (1873); *Die Heve* (1875), a philosophical drama, marked by dignity of expression and rather skillful character drawing; *Von Gottes Gnaden* (1883), more a bloody play than a tragedy; *Fahrendes Volk* (1875; 4th ed., 1894), and *Winternächte* (1885), volumes of poems. He also rendered into German (1886) Byron's *Marino Faliero*, and for the *Denkmale der Geschichte und Kunst Bremens* (1877) prepared a history of the local cathedral.

FITTIG, fit'ik, RUDOLF (1835-1910). A German chemist, born at Hamburg. He studied chemistry at Göttingen and became assistant to Wöhler, the celebrated organic chemist, in 1858. From 1860 to 1870 he taught at Göttingen, in the latter year was appointed full professor of chemistry at Tübingen, and in 1876 was made professor at Strassburg. His literary activity consisted mainly in his reëditing Wöhler's work on organic chemistry. On the other hand, his name is connected with a num-

ber of original contributions, which have formed an integral part of the science of organic chemistry. He discovered the interesting class of substances termed *lactones* (anhydrides formed from compounds which are at once acids and alcohols, just as *esters* are formed by the action of acids on alcohols). Furthermore, he effected the synthesis of a number of interesting compounds of carbon and hydrogen and discovered phenanthrene and other important substances in coal tar.

FITTING, fit'ing, HEINRICH HERMANN (1831-). A German jurist. He was born at Mauchenheim and studied at Würzburg, Heidelberg, and Erlangen. In 1857 he was appointed professor of Roman law at Basel, and in 1862 he was called in the same capacity to Halle. He retired to private life in 1902. From 1864 to 1878 he was engaged in publishing the *Archiv für die civilistische Praxis*. He wrote: *Der Reichs-civilprozess* (7th ed., 1890); *Das Reichs-konkursrecht und Konkursverfahren* (new ed., 1904); *Die Anfänge der Rechtsschule zu Bologna* (1888).

FITWEED. See EBYNGO.

FITZ (AS. *fit*, OF. *fis*, *fis*, Fr. *fil*s, from Lat. *filius*, son). An old Norman word signifying "son." Like the Scottish *Mac*, the Irish *O*, and the Oriental *Ben*, it is prefixed to proper names to signify descent, as in the Norman names Fitzwilliam, Fitzwalter, Fitzgerald. A later application of it has been to denote the natural sons of royalty, as in Fitzroy, Fitzjames, and Fitzclarenc.

FITZ, REGINALD HEBER (1843-1913). An American physician, born at Chelsea, Mass. He graduated in 1864 (M.D., 1868) from Harvard University, where, after studying in Vienna, Berlin, and Paris, he was instructor in pathological anatomy in 1870-73, assistant professor in 1873-78, and professor from 1878 to 1908. In the latter year he became professor emeritus. He also served as physician to the Boston Dispensary in 1871-82 and to the Massachusetts General Hospital from 1887 to 1908. In 1894 he was president of the Association of American Physicians. Besides his contributions to medical journals, he is joint author with Horatio C. Wood of *The Practice of Medicine* (1897).

FITZALAN, HENRY, twelfth EARL OF ARUNDEL (c.1511-80). An English statesman, son of William and Anne Percy. He was a godson of Henry VIII and early entered his service. For his part in the storming of Boulogne (1544) he was rewarded with the office of Lord Chamberlain, in which position he was retained by Edward VI. But Warwick was jealous of Arundel's influence over the King and removed him from the council in 1550 on charges which were never proved. In 1551, when Somerset was for a second time sent to the Tower, Arundel seemed to be implicated, but he was pardoned, without trial, on signing a confession and paying a heavy fine. Arundel feigned acquiescence in Northumberland's plan to bring Lady Jane Grey to the throne, but worked for Mary. He kept in favor with her while she was Queen and was made her Lord Steward; and he dared to remonstrate with her on her treatment of Elizabeth. When Elizabeth was crowned, Arundel was Lord High Constable and was kept in office, but quarreled with her in 1562 after she had reproached him for planning for the succession (he worked for Lady Catharine Grey) during her illness, and two years later he resigned his

post as Lord Steward. Received again into the Queen's favor, he began to plot in behalf of Mary Stuart and tried to bring about her marriage with Norfolk, which he trusted would result in the overthrow of Elizabeth. On the discovery of the plot he was kept under guard during the Northern Insurrection; but he had not committed himself in the rebellion and in 1570 was recalled to the council. A year later, when it was proved that he had long been plotting sedition, he was arrested and kept under guard until the end of 1572. The last years of his life were passed in quiet retirement. Consult the "Life," apparently by his chaplain, edited with notes by Nichols in the *Gentleman's Magazine* for 1833.

FITZALAN, RICHARD, EARL OF ARUNDEL AND WARRENNE (c.1307-76). An English soldier and admiral of Edward III, second Richard of the house, son of Edmund and Alice Warrenne. He did not come into the title until 1331, after the death of Mortimer. In 1337 he was made joint commander against Scotland, after the failure to capture Dunbar was put in sole command, completed a truce with the Scotch, and followed Edward III to Brabant. Parliament made him admiral in 1340. He fought at Sluis, was a commissioner to Parliament in 1341, and took part in the siege of Tournai. In 1344 he was one of the lieutenants of Aquitaine and in 1345 put away his wife, Isabella le Despenser, and married Eleanor, widow of Lord Beaumont and daughter of Henry of Lancaster. He commanded one of the three divisions at Crécy and was in the siege of Calais. He treated with the Pope and, after taking part in the battle of Winchelsea (1350), was employed on diplomatic service in Scotland, Luxemburg, and France. He was regent of England in 1355. In 1365 he was summoned before the Pope by William de Lenne, Bishop of Chichester, but was successful in his resistance, thanks to the help of the King. He probably took part in the expedition to relieve Thouars in 1372. He was very rich and made heavy loans to the hard-pressed King.

FITZALAN, RICHARD, EARL OF ARUNDEL AND SURREY (1346-97). An English admiral and a leader of the barons against King Richard II. He was son of Richard and Eleanor Fitzalan and succeeded his father in 1376. He was one of the standing council appointed by the Good Parliament, was chief butler at Richard II's coronation, and in 1380 was made a commissioner to regulate the royal household. He had been appointed admiral of the West and accomplished very little, though French historians call his victory over the French off Margate (1387) the salvation of England from invasion. He joined the baronial opposition and attacked the King's favorites (1386). A year later the King, having got his judges to declare Arundel's commission illegal, tried to arrest him, but only strengthened the opposition and drove it to arms. In 1388 the Earl went to sea again and brought home much loot from La Rochelle. Later in the year, with the other lords appellant, he was retired from the council, but soon after was restored. Peace now seemed assured, but a personal quarrel between Arundel and John of Gaunt about 1393 renewed the trouble, and soon Fitzalan, his brother Thomas, who was Archbishop, Gloucester, and Warwick formed a conspiracy against the King. This was discovered by the King, and Arundel, urged by his brother, surrendered himself, was impeached, condemned,

and executed. He had been very popular, and the people made pilgrimages to his tomb in the Augustinian Friars Church, Broad Street, London. His death hurried the end of the King's reign.

FITZALAN, THOMAS, EARL OF ARUNDEL AND SURREY (1381-1415). An English soldier under Henry IV. He was son of the third Richard Fitzalan and Elizabeth Bohun. On his father's death (1397), he was put in the brutal keeping of John Holland, Duke of Exeter. He finally escaped from Reigate and joined his uncle Thomas, the deposed Archbishop, and with him cast in his fortunes with Henry of Derby, with whom he landed at Ravenspur in 1399. Henry's success made Richard able to take vengeance on the Hollands; his estates and titles were restored, and he fought for several years against Owen Glendower, but accomplished practically nothing. In 1405 he helped put down the revolt of Scrope and Mowbray and put the leaders immediately to death, against the advice of his uncle. In 1405 he accompanied the King into Wales, where he fought with less ill fortune than before; and he married Beatrix, a natural daughter of John I of Portugal. He now joined the Beauforts, and Henry V named him treasurer, constable of Dover, and guardian of the Cinque Ports, and took him with him into France. He was taken sick at Harfleur and died on his return to England, leaving no children.

FITZBALL, EDWARD (properly BALL) (1792-1873). An English dramatist. He was born at Burwell, Cambridgeshire, was educated in a private school at Newmarket, and became a printer's apprentice in 1809. In 1819, after having unsuccessfully edited a magazine at Norwich, he changed his name to Fitzball, by prefixing his mother's name to his own, and began to write for the stage. His first success was won by his *The Innkeeper of Abbeville*, performed at the Norwich Theatre in 1820 and in London in 1821-22. This was followed in 1822, by an adaptation of *The Fortunes of Nigel* and an original drama entitled *Joan of Arc*. For the next 25 years Fitzball was the most prolific dramatic author in England, turning out an enormous number of comedies, tragedies, and melodramas, most of which were written to order for the managers of various metropolitan theatres. He was attached in succession to the Adelphi, Covent Garden, and Drury Lane theatres, as a stock dramatist. Among his numerous successes were: *Peveril of the Peak* (1823); *Waverly* (1824); *The Floating Beacon* (1824); *The Pilot* (1825), an adaptation of Cooper's novel, which ran over 200 nights; *The Flying Dutchman* (1828); *The Red Rover* (1828); *The Devil's Elbow* (1830); *Hofer, the Tell of the Tyrol* (1832); *Jonathan Bradford* (1833), a melodrama which ran over 400 nights at Covent Garden; *Tom Cringle* (1834); *Walter Tyrell* (1835); *Zazzeriozu* (1836); *The Momentous Question*; *The Miller of Derwentwater*; *Nitocris* (1859). Besides numerous popular ballads and songs, he wrote the librettos for Balfe's operas, *The Siege of Rochelle* (1835), *Joan of Arc*, *Diadeste*, *Keolanthe* (1840), and *The Maid of Honor* (1847); for Donizetti's *La Favorita*; for Bishop's *Adelaide*; and Wallace's *Maritana*. He published his memoirs under the title *Thirty-five Years of a Dramatic Author's Life* (1859).

FITZGERALD. A city and the county seat

of Ben Hill Co., Ga., 70 miles southeast of Macon, on the Seaboard Air Line, the Atlanta, Birmingham, and Atlantic, and the Ocala Southern railroads (Map: Georgia, C 4). It contains cotton and oil mills, a cotton compress, fertilizer plants, and railroad repair shops, and carries on a trade in timber and turpentine. The water works and electric-light plant are owned by the municipality. Pop., 1900, 1817; 1910, 5795.

FITZGERALD, DESMOND (1846-). An American civil engineer, born at Nassau, New Providence, Bahama Islands, and educated at Phillips Academy, Andover, Mass. He spent 40 years in practice as a hydraulic engineer, chiefly in connection with the construction and maintenance of the water-supply system of Boston. From 1896 to 1900 he was a member of the Massachusetts Topographical Survey Commission, and in 1904 he served as consulting engineer for the sewage and water-supply systems of Manila, Philippine Islands. He was president of the American Society of Civil Engineers in 1899. His publications include *History of the Boston Water Works from 1868 to 1876* (1876), and *A Short Description of the Boston Water Works* (1895).

FITZGERALD, LORD EDWARD (1763-98). An Irish politician and revolutionist. The fifth son of the 17 children of the first Duke of Leinster, he was born Oct. 15, 1763, at Carton Castle, near Dublin, and educated in France. Fitzgerald joined the English army and in 1781 went to the United States. He was wounded at the battle of Eutaw Springs. In 1783 he returned to Ireland to represent Athy in the Irish Parliament. A taste for exploration afterward led him to journey by compass through the woods from Fredericton, New Brunswick, to Quebec. In 1790 he returned and sat in the Irish Parliament as member for Kildare. Attracted by the French Revolution, he visited Paris in 1792 and was cashiered from the English army for attending a revolutionary banquet at which he expressed Republican sympathies and renounced his title of nobility. During this visit he married the putative daughter of Philippe "Egalité," Duke of Orleans, and Madame Genlis, the celebrated Pamela, who was afterward discovered to be the child of Mary Sims, of Newfoundland, by De Brixey, a French captain. His sympathies with the struggles of his countrymen led him to join the United Irishmen in 1796, and he went to France to arrange, with the Directory, an invasion to support an Irish revolution. Soon after his return the plot became known to the English government, and Fitzgerald, after a desperate resistance, during which he was severely wounded, was captured and died in prison. His widow married Mr. Pitcairn, American Consul at Hamburg, but soon separated from him, and after a checkered existence died in poverty in Paris in 1831. Consult: Moore, *Life and Death of Edward Fitzgerald* (2d ed., London, 1875); Campbell, *Edward and Pamela Fitzgerald* (ib., 1904); Taylor, *Life of Lord E. Fitzgerald* (New York, 1904).

FITZGERALD, EDWARD (1809-83). An English poet and translator, whose exceptional qualities were obscured by an equally exceptional modesty, and whose fame is due almost wholly to his translation, from the Persian, of the *Rubáiyát* of Omar Khayyám. Although of Irish ancestry, he was born at Bredfield House, near the market town of Woodbridge in Suffolk; and it was here that he elected to spend his

life in strict seclusion—almost a hermit's life in its sequestered tranquillity and remoteness from the outside world. The family name was Purcell, but on his grandfather FitzGerald's death (1818) his father took the arms and the name of his wife. He was educated at Trinity College, Cambridge, taking his degree in 1830, and there formed lifelong friendships with men since famous, among others Spedding and Thackeray. With the Tennysons he did not become intimate until later. A good picture of FitzGerald's academic life is preserved in *Euphranor*, his earliest printed work—a sort of Platonic dialogue, in which the speakers are thinly disguised under symbolic or classical names; and his lasting fondness for Cambridge is proved by the occasional visits he made down to his closing years. His brief experience of married life resulted unhappily. His wife was Lucy, daughter of Bernard Barton, the Quaker poet of Woodbridge and one of FitzGerald's closest friends. But he was temperamentally unfitted for matrimony, and they soon separated by mutual consent. Henceforth he contented himself with the companionship of his books and the luxury of a few chosen friendships. His simple life was varied by occasionally "pottering about the midland counties of England" or taking short coasting trips in his own yacht. A typical summer is described in his own words, as follows: "A little Bedfordshire—a little Northamptonshire—a little more folding of the hands—the same faces—the same fields—the same thoughts occurring at the same turns of road—this is all I have to tell of; nothing at all added—but the summer gone."

In literature, as in other things, FitzGerald was an epicure. He read slowly and of none but the best. Sophocles and Tacitus, Homer and Shakespeare, were the authors that he lived with. The Greek Anthology occupied him an entire season. Probably no writer who took the trouble to publish his writings has ever been so indifferent to their fate as FitzGerald. Just what first awoke him from his dreams among his turnips and spurred him on to authorship is not clear. In 1846 Carlyle and Professor Cowell, the Orientalist, became factors of importance in his life, and it may have been in a measure due to such mental stimulus that five years later *Euphranor* was published—anonymously, as with one exception were all his writings. A year later (1852) appeared *Polonius*, a collection of wise saws gathered from his favorite books and interesting to-day chiefly for its graceful preface. In 1853 the first of his famous translations appeared, *Six Dramas of Calderón*, with his own name appended; but an attack by an indiscriminating and unknown reviewer in the *Athenæum* effectually dampened his brief desire for personal glory; and neither the praise of men like Carlyle, Thackeray, and James Russell Lowell, nor the Calderón medal sent, he "doubts not, at Mr. Lowell's instance," could tempt him to write again under his own signature. FitzGerald's intimacy with Professor Cowell, which had ripened while they read together the plays of Calderón, culminated in their study of the Persian poets, and bore important fruit in FitzGerald's translation of the *Salâmân and Absâl*, of Jâmi, in 1856, and the *Rubâiyât* three years later. The story of how the now famous quatrains first claimed public attention is well known. FitzGerald offered some of "the less wicked" of them to

Frazer's Magazine; but as they failed to appear, he made a present of them, two years later, to his publisher, Mr. Quaritch, who issued them in a brown-covered pamphlet at five shillings. In course of time they found their way to a penny box outside the bookseller's door. It was there that Mr. Whiteley Stokes bought the copy which he gave to Dante Gabriel Rossetti, who in turn passed it on to Mr. Swinburne and thus laid the foundation of the Omar cult in England.

Only once after this did FitzGerald arouse himself to activity—in the winter of 1864-65, when he published two more Calderón plays and his version of the *Agamemnon*. In 1880-81 appeared, privately printed, his translations of the two *Œdipus* tragedies. *Readings in Crabbe* (1882) was his last publication. Each year his life grew quieter; his days were spent "in boat or vessel as in a moving chair, dispensing a little grog and shag to those who do the work." There is less and less of literature in his correspondence. New books did not appeal to him, and he could see little merit in Emerson, George Eliot, or Victor Hugo. His old books continued to suffice; and the only new taste that he formed late in life was for the poems of Crabbe. And by a curious coincidence, he died while on a visit to the home of Rev. George Crabbe, a grandson of the poet.

Whatever merit FitzGerald's other writings possess, there is no question that they are quite eclipsed by his famous rendering of the *Rubâiyât*. As an instance of the deliberate transplanting of a poet from one nation to another widely separated by language and ideals and the lapse of centuries, and of having that poet take fresh root and flourish with renewed life, the *Rubâiyât* stands unique. FitzGerald's theory of translation was peculiar. He took great liberties with the original, aiming less to reproduce the exact thought than the atmosphere, and boldly rejecting whatever, through difference of social or artistic standards, might tend to arouse in Anglo-Saxon minds thoughts alien to the intention of the poet. Omar Khayyâm, almost unknown to European scholars until transmuted by the magic of FitzGerald's genius, is now probably the most familiar of all Persian poets to the Western world. Versions, in both prose and verse, have multiplied rapidly, many of them far more faithful to the original than FitzGerald's version; and wonder is sometimes expressed that none of these attains a similar popularity. It is only just beginning to be recognized that FitzGerald's *Rubâiyât* is held in honor, not as Persian, but as English poetry, and that to the great majority the sources are as unimportant as the sources of a play of Shakespeare. Whatever inspired him, the result is here—a piece of exquisite workmanship, "coral building in literature," as Edmund Gosse has defined it. The scrupulous care, the loving revision and endless polishing which finally resulted in the *Rubâiyât* as it stands to-day can be understood only by a comparison of the texts in the successive editions. The result is a rare delicacy of phrase, a fine instinct for the one appropriate word, that distinguished FitzGerald among the poets of his time and country.

bāyāt of Omar Khayyām (1st ed., ib., 1859; 2d ed., 1868; 3d ed., 1872); *Agamemnon* (1st ed.; ib., 1865; 2d ed., 1876); *The Works of Edward FitzGerald* (London, 1887); *Letters and Literary Remains* (ib., 1889), ed. by William Aldis Wright; *Letters of Edward FitzGerald* (1894); *Letters of Edward FitzGerald to Fanny Kemble* (New York, 1895); *FitzGerald's Miscellanies* (London, 1900); *More Letters of Edward FitzGerald* (ib., 1901); *Variorum and Definitive Edition of the Writings of Edward FitzGerald* (New York, 1902-03), ed. by Bentham. Consult: Thomas Wright, *Life* (2 vols., London, 1904); A. C. Benson, *FitzGerald* (in "English Men of Letters Series," New York, 1905); an English prose translation from the original Persian by Justin Huntly McCarthy (London, 1889, and Portland, Me., 1896); FitzGerald's text, with commentary by H. M. Batson, and with an introduction by E. D. Ross concerned with the life and times of Omar (London, 1900); and *Centenary Celebration Souvenir* (Ipswich, 1909), for an account of the FitzGerald centenary.

FITZGERALD, GEORGE FRANCIS (1851-1901). A British scientist, born at Dublin, Ireland, a son of Bishop William Fitzgerald. He was educated at Trinity College, Dublin, and became professor of natural and experimental philosophy at Dublin University. In 1888 he was appointed president of Section A of the British Association at Bath, and examiner to London University. Among his numerous publications are: "On the Possibility of Originating Wave Disturbances in the Ether by Means of Electric Forces," in the *Transactions of the Royal Dublin Society*, vol. i; *On an Analogy between Electric and Thermal Phenomena* (1884); *On the Limits to the Velocity of Motion in the Working Parts of Engines* (1886); and the posthumous *Scientific Writings of the Late George Francis Fitzgerald*, ed. by Joseph Larmor (1902).

FITZ-GERALD, JAMES NEWBURY (1837-1907). An American Methodist Episcopal bishop, born at Newark, N. J. He was admitted to the State bar of New Jersey and was commissioned master of chancery in 1858. Ordained deacon in the Newark conference of his denomination (1864) and elder (1866), he served at various times as presiding elder of the Newark, Newton, and Jersey City districts; was member of the general conferences of 1876, 1880, 1884, and 1888 (serving as assistant secretary in 1876 and 1880); and was secretary of the Newark Conference for 11 years and recording secretary of the Methodist Episcopal Missionary Society from 1880 to 1888, when he was elevated to the episcopacy. In 1895 he made the episcopal visitation of the South American and European conferences. He received the degree of D.D. from Wesleyan University in 1880 and that of LL.D. from Hamline University in 1889. For many years he was a trustee of Drew Theological Seminary and vice president of the board. He was president (1897-1907) of the Ocean Grove Camp Meeting Association, a position which conferred upon him the duties and powers of mayor of a prominent summer resort, famous as a centre of religious and musical activities. He died at Hongkong, on an episcopal visitation to the Oriental mission conferences. Bishop FitzGerald's mother, MRS. JOHN DRISCOLL (OSSE MELINDA BOYLAN) FITZ-GERALD, was president of

the Women's National Holiness Association; an original member of the Women's and Children's Hospital; a manager of the Newark Female Charitable Society and of the Home for Aged Women; and founded and (until her death) was president of the board of managers of The Society to Provide and Maintain a Home for the Friendless in Newark, N. J.

FITZGERALD, JOHN DAVID, LORD (1816-89). An Irish jurist, born in Dublin. He was called to the bar in 1838 and was elected to Parliament in 1852 by the Liberals as representative for Ennis. When the first Palmerston ministry was formed three years later, he was made Solicitor-General for Ireland, and in 1856 he became Attorney-General and a member of the Irish Privy Council. In 1860 he left Parliament and was appointed a judge of the Queen's Bench in Ireland. He was appointed a lord of appeal, with a life peerage, in 1882, and at the same time received a position in the English Privy Council. He showed marked knowledge and ability in the House of Lords in his debates upon Irish questions, and his services on the judicial committee of the Privy Council were equally eminent. Many important charges were brought before him while upon the Queen's Bench in Ireland, including the cases of the Fenian conspirators in 1865-66, of Sullivan and Pigott for seditious libel in 1868, and of Parnell in 1880-81. In 1885 he refused the lord chancellorship of Ireland and an hereditary peerage.

FITZ-GERALD, JOHN DRISCOLL, II. (1873-). An American Hispanic scholar, nephew of James Newbury Fitz-Gerald. He was born in Newark, N. J., graduated from Columbia University in 1895 (Ph.D., 1906), and also studied Romance philology at the universities of Berlin, Leipzig, Paris, and Madrid, becoming *Elève titulaire* (1897) and *Elève diplômé* (1902) de l'Ecole des Hautes Etudes, Paris. Between 1898 and 1909 he was assistant, tutor, and instructor at Columbia, and in the latter year he became assistant professor of Romance languages and literatures at the University of Illinois. In 1910 to 1913 he taught in the Columbia University Summer Session. In 1914 the American Association for International Conciliation sent him as delegate to South America. He became a member of the Hispanic Society of America and a corresponding member of the Spanish Royal Academy. He edited *La vida de Santo Domingo de Silos, por Gonzalo de Berceo* (1904), and (in collaboration with Leora A. Fitz-Gerald) *Lope de Vega's Novelas* (1913); is author of *Versification of the "Cuaderna Via" as Found in Berceo's Vida de Santo Domingo de Silos* (1905), *A Reading Journey through Spain* (1909), and *Rambles in Spain* (1910); had charge of Hispanic subjects in the second edition of the NEW INTERNATIONAL ENCYCLOPÆDIA; and is associate editor of the *Romanic Review*.

FITZGERALD, OSCAR PENN (1829-1911). An American clergyman, born in North Carolina. He entered the ministry of the Methodist church South in 1853. For a time he was editor of the *Pacific Methodist* of San Francisco. From 1867 to 1871 he was Superintendent of Public Instruction for the State of California. At the same time he was ex-officio editor of the *California School Journal*. From 1878 to 1890 he was editor of the *Christian Advocate* of Nashville, Tenn. In 1890 he was selected Bishop of the Methodist Episcopal church

South. His works include: *California Sketches New and Old* (4th ed., 1880; 2d series, 1881); *Glimpses of Truth* (1883); *Centenary Cameos, 1784-1884* (1885); *Thomas O. Summers: A Biography* (1888); *Augustus B. Longstreet: A Life Sketch* (1891); *The Epworth Book* (1893); *John B. McFerrin: A Biography* (1893); *The Whetstone, the Day, and the Work* (1897); *Sunset Views* (1900); *Upper Room Meditations* (1903); *Fifty Years' Observations, Opinions, Experiences* (1903); *Class Meetings* (n.d.); *Daily Bread* (n.d.); *Christian Meetings* (n.d.). He was also the author of a series of sketches of early Methodists issued in pamphlet form.

FITZGERALD, PERCY HETHRINGTON (1834-). A British author and critic. He was born at Fane Valley, County Louth, Ireland, and was educated at Stonyhurst College, Lancashire, and at Trinity College, Dublin. He was called to the Irish bar and was for a time crown prosecutor on the northeastern circuit. Going to London, however, he became a contributor of fiction to Charles Dickens's magazine, *Household Words*, and later dramatic critic for the *Observer* and the *Whitehall Review*. In the long list of Mr. Fitzgerald's subsequent writings are numerous biographies and works relating to the history of the theatre; among them are: the *Life of Sterne* (1864); *Charles Lamb* (1866); *Life of David Garrick* (1868); *Life of George IV* (1881); *The Kembles; Life of William IV* (1884); *Lives of the Sheridans* (1886); *Henry Irving: A Record of Twenty Years at the Lyceum* (1893); *The Romance of the English Stage* (1874); *A New History of the English Stage* (1882); *Memoirs of Charles Dickens* (1914); *Worldlyman* (1914). With W. G. Wills he wrote *Vanderdecken*, which was brought out by Irving at the Lyceum. Consult his *Memoirs of an Author* (London, 1895).

FITZGERALD, THOMAS (1796-1855). An American lawyer and politician, born at Germantown, Herkimer Co., N. Y. He served under Gen. W. H. Harrison in the War of 1812, was admitted to the New York bar, and removed to Indiana, where he became a member of the State Legislature, and thence to Michigan. In 1848-49 he represented Michigan in the United States Senate, filling the vacancy which resulted through the resignation from office of Gen. Lewis Cass. He was subsequently a leader in the councils of the Democratic party in Michigan. As a commissioner for the investigation of the so-called "wild-cat" banks, he greatly contributed towards their final eradication. In 1837 he became a regent of the University of Michigan.

FITZGERALD, THOMAS, Lord OFFALY, tenth EARL OF KILDARE (1513-37). A vice deputy of Ireland who acted for his father, Gerald, ninth Earl of Kildare, when he was summoned to London in 1534 to answer charges of maladministration as Lord Deputy. A rumor that his father had been executed in the Tower, and that the death of his uncles and himself had been determined upon, made him renounce his allegiance and declare war on the government. His first successes were tarnished by the murder of Archbishop Allen, and sentence of excommunication was passed upon him. He besieged Dublin Castle, but had to retire, and Sir William Skeffington crushed the rebellion by capturing Maynooth, the stronghold of the Geraldines, in March, 1535. Fitzgerald's father

had been attainted and died in the Tower from the effects of an old bullet wound, but not before he had heard of and expressed gratification at his son's rebellion. Lord Thomas, after leading a wandering life for some months with a price set upon his head, surrendered to Lord Leonard Grey and was sent to England. He was committed to the Tower, with his five uncles, and although three of them had taken no part in the rebellion, the six Geraldines were drawn, hanged, and quartered at Tyburn, Feb. 3, 1537. Restitution of the family estates was made by Edward VI, and Queen Elizabeth repealed the bill of attainder. Consult Kildare, *The Earls of Kildare* (Dublin, 1858), and Lodge, *Peerage of Ireland* (ib., 1789).

FITZGIBBON, GERALD (1837-1909). An Irish jurist born in Dublin. He was educated at Trinity College (Dublin) and was admitted to the Irish bar in 1860 and to the English bar in 1861. He became queen's counsel in 1872. He served as law adviser at Dublin Castle in 1876, as Solicitor-General of Ireland in 1877-78, and as bencher at King's Inn in 1877 and at Lincoln's Inn in 1901. He was Commissioner of National Education for Ireland in 1884-96, and Judicial Commissioner of Educational Endowments in 1885-97. From 1898 until his death he was Lord Justice of Appeal in Ireland. In 1904-05 he was chairman of the Trinity College Dublin Estates Commission.

FITZGIBBON, JAMES (1781-1863). A Canadian soldier. He was born in Ireland and was indebted solely to his own exertions for his early education. As a private, he served in Holland in 1799 in the war against Napoleon and later (1801) before Copenhagen. Removing to Canada, he was given command of a small detachment in the War of 1812, and later he took part in several actions, including those of Stoney Creek and Fort George (at Niagara-on-the-Lake). At Beaver Dam Fitzgibbon, in command of 47 infantry soldiers and aided by a body of Indians, captured a force of Americans consisting of 450 infantry, 50 cavalry, and two guns. In 1822 he was appointed assistant adjutant general of militia in Upper Canada. During the Upper Canada rebellion of 1837-38 his foresight and rapid decision saved Toronto from the schemes of the disaffected. For this he received a land grant of 5000 acres and the thanks of the Legislature, but the land grant was never completed. Fitzgibbon was clerk of the Legislative Assembly in 1827-29 and clerk of the Legislative Council in 1829-35. He was created a military knight of Windsor in 1850. He afterward resided in England.

FITZGIBBON, JOHN, EARL OF CLARE (1749-1802). An Irish statesman. He was born near Donnybrook and was educated at Trinity College, Dublin, and Christ Church, Oxford. He entered the bar in his native land in 1772, in 1778 became member of the Irish House of Commons for Dublin University, and in 1783 was appointed Attorney-General. In 1789 he became Lord Chancellor and was made Baron Fitzgibbon and began to exercise great influence in the House of Lords. He is chiefly remembered as the strongest personality that labored for the union of Ireland with England; and this fact, joined to his persistence in exerting his weighty influence against the Roman Catholics, has caused his name to be execrated by the most of his countrymen. But friends of his own party and religion balanced

his severity with his sincerity, his insolence and bad temper with his bravery and ability, his vanity and ambition with his undoubted private virtues.

FITZGIBBON, MARY AGNES (1851-). A Canadian writer. She was born in Belleville, Ontario, and was educated there and at Pinehurst Academy, Toronto. In 1894 she founded the Women's Canadian Historical Society, of which she became corresponding secretary, and in 1905 she was one of the founders of the Female Immigrants' Receiving Home, Toronto. She published: *A Trip to Manitoba; or, Roughing it on the Line* (1880); *Home Work* (1887); *A Veteran of 1812* (1895; 2d ed., 1898), being a biography of her grandfather, Col. James Fitzgibbon; *Historic Days* (1898); *A Trip to Niagara* (1909); and, with Sara Mickle, *The Cabot Calendar, 1497-1897* (1897).

FITZHERBERT, ALLEYNE, BARON ST. HELENS (1753-1839). An English diplomat, son of William Fitzherbert and of Mary Meynell, both friends of Dr. Johnson. He was educated at Derby and Eton, and at St. John's, Cambridge, where he got his degree in 1774. In 1777 he was made Minister to Brussels, and five years later he was sent to Paris to effect a treaty with France, Spain, and the United Provinces. He probably took a large part, as well, in the negotiations which led up to the peace with America. In 1783 he was sent to Russia and accompanied the Empress Catharine on her trip through the Crimea in 1787. At the end of this year he became First Secretary to the new Lord Lieutenant of Ireland, the Marquis of Buckingham. He held this post until the spring of 1789, when he went to The Hague as Envoy Extraordinary. Two years later he was sent to Madrid to settle the question of Nootka Sound and the Southern whale fishery; and in 1794 he was reappointed to The Hague, now as Ambassador. In 1801 he went on his last mission, to attend the coronation at Moscow, and concluded a treaty with Russia and an agreement with Denmark and with Sweden. He received the title of St. Helens in 1791, was pensioned in 1803, and lived his last years in London. He was not married.

FITZHERBERT, SIR ANTHONY (1470-1538). An English jurist, born in Derbyshire. He was educated at Oxford and Gray's Inn, was sergeant at law to Henry VIII (1516), became a judge, was knighted, and in 1524 was one of the peace commissioners to Ireland. Fitzherbert signed Wolsey's impeachment (1529), defended the second royal marriage, and was one of the judges in the More and Fisher trials. He reached his literary high-water mark with his first book, *La grande abridgement* (1514), but he also wrote *The Office and Authority of Justices of the Peace* (1538) and the *New Natura Brevium* (1534); and possibly a *Book of Surveying and Improvements* (1523) and a *Book of Husbandry* (1523), both sometimes attributed to another Anthony Fitzherbert.

FITZHERBERT, MARIA ANNE (SMYTHE) (1756-1837). The unacknowledged wife of George IV of England. She was born on the estate of her father at Brambridge, Hampshire, and in 1775 married Edward Weld, who died in the same year. In 1778 she married Thomas Fitzherbert, who died in 1781. She first met Prince George of Wales, who was six years her junior, in 1785. The Prince fell in love with her on sight, but she refused to accept his

attentions and spent some months on the Continent to escape them. In December, however, she returned to England and was married to him on the 21st of the month. The marriage was never either publicly avowed or disavowed by George, but it was known to both that the Marriage Act of 1772 invalidated any marriage contracted by a member of the royal family under 25 years of age without the King's consent. Mrs. Fitzherbert was a Roman Catholic, and by the Act of Settlement, if the heir apparent married a Roman Catholic, he forfeited his right of succession. There was a general understanding that a marriage had taken place, however, and she was received by the best society and by members of the royal family and was treated by Prince George as his wife. Some time before his marriage to Caroline he ceased for a time to live with her, but in 1800 the connection was resumed—after the Pope had formally ruled that the marriage with Mrs. Fitzherbert was valid—and continued until 1803, when it was finally terminated at her desire because of his attentions to Lady Hertford. William IV offered to make her a duchess and allowed her to use the royal livery. Consult Langdale, *Life of Mrs. Fitzherbert* (London, 1856), and Wilkins, *Mrs. Fitzherbert and George IV* (ib., 1905).

FITZHUGH, GEORGE (1802-81). An American sociological and political writer. He was born in Prince William Co., Va. Self-educated, he practiced law and began to write in defense of slavery, both in newspapers and in *De Bow's Review*. His remarkable philosophy of slavery, which was probably more extreme than that of any other Southerner, controverting all the principles of the Founders, including Jefferson, and expressed in a powerful way, was presented in *Sociology for the South, or the Failure of Free Society* (1854), and *Cannibals All, or Slaves Without Masters* (1856). He died at Huntsville, Tex.

FITZ-HUGH, THOMAS (1862-). An American Latin scholar, born at Longwood, Goochland Co., Va. He was educated at the University of Virginia (A.M., 1883), and also studied at Rome and Pompeii, in Greece and the Orient, and at the University of Berlin. After teaching in North Carolina and Virginia for several years he was professor of Latin at Central University, Kentucky, in 1883-84 and at the University of Texas from 1889 to 1899, when he accepted a corresponding position at the University of Virginia. Besides his contributions to philological journals, his writings include: *The Philosophy of the Humanities* (1897); *Outlines of a System of Classical Pedagogy* (1900); *Prolegomena to the History of Italic-Romantic Rhythm* (1908); *The Sacred Tripudium* (1909; 3d ed., 1910); *The Literary Saturnian* (2 vols., 1910).

FITZINGER, fits'ing-er, LEOPOLD JOSEPH (1802-84). An Austrian zoölogist, born in Vienna. In 1826 he published the work entitled *Neue Klassifikation der Reptilien nach ihren natürlichen Verwandtschaften*, which necessitated a complete remodeling of the system of Brongniart. He was appointed director of the Zoölogical Garden at Munich in 1863, and in 1865 he was called in the same capacity to Pesth, where he continued to reside until 1873. His works include: *Der Vögel* (1862-63); *Ueber das System und die Charakteristik der natürlichen Fahren der Vögel* (1856); *Der Hund*

und seine Rassen (1876); *Geschichte des Hof-naturalienkabinetts zu Wien* (1865-80).

FITZ-JAMES, fits-jámz', JAMES (1670-1734). See BERWICK, JAMES FITZ-JAMES, DUKE OF.

FITZMAURICE, EDMOND GEORGE FITZMAURICE, BARON (1846-). An English diplomat. He was born in London, a son of the fourth Marquis of Lansdowne and of Emilie de Flahaut, and was educated at Eton and at Trinity College, Cambridge. He represented Calne in the House of Commons (1869-85) and Cricklade in 1898-1905. In 1880 he was made a commissioner for the reorganization of the Turkish provinces and Crete under the Treaty of Berlin, and he was Second Plenipotentiary at the Danube Conference (1882-83) and Undersecretary of State for Foreign Affairs in 1882-85 and 1905-08. In 1906 he was created Baron Fitzmaurice of Leigh, and in 1908-09 he was Chancellor of the Duchy of Lancaster and a member of the Liberal cabinet. He wrote on foreign politics, and a *Life of Lord Shelburne* (1875-77); *Sir William Petty, the Political Economist* (1895); *Life of Granville G. Leveson-Gower, Second Earl Granville* (1905).

FITZMAURICE, SIR MAURICE (1861-). An English civil engineer, educated at Trinity College, Dublin. He was apprenticed to the great engineer Sir Benjamin Baker. Fitzmaurice was engineer of design and construction (1904-08) of the Rotherhithe Tunnel under the Thames, and of such other works in England as the new Vauxhall Bridge, the Kingsway and tramway subway, the London electric tramways, and the extension of the London drainage system. He was engineer of the Nile reservoir dam at Assuan, completed in 1902. He wrote *Plate-girder Railway Bridges* (1895) and technical memoirs.

FITZMAURICE, PETTY. See LANSDOWNE, HENRY PETTY-FITZMAURICE.

FITZMAURICE, WILLIAM P. See SHELBURNE, EARL OF.

FITZMAURICE-KELLY, JAMES (1858-). An English writer on Spanish literature, Gilmour professor of Spanish language and literature at the University of Liverpool, and (1908) Norman MacColl lecturer at Cambridge. In 1907 he lectured at various American universities for the Hispanic Society of America, and received the honorary degree of L.H.D. from Columbia University. He became fellow of the British Academy, corresponding member of the Real Academia Española de la Lengua and of the Real Academia de la Historia (Madrid); and a Knight Commander of the Order of Alfonso XII. He contributed on Spanish literature to the eleventh edition of the *Encyclopædia Britannica* and to the *Cambridge Modern History*; wrote a *Life of Miguel de Cervantes Saavedra* (1892), *A History of Spanish Literature* (1898; in Spanish, 1901; in French, 1904; 2d ed. in French, 1913), *Lope de Vega and Spanish Drama* (1902), *Cervantes in England* (1905), *Chapters on Spanish Literature* (1908), *Miguel de Cervantes Saavedra: A Memoir* (1913), and *Bibliographie de l'histoire de la littérature espagnole* (1913); and edited *The Complete Works of Cervantes* (1901-), *Don Quixote*, with John Ormsby (1899-1900), and the *Oxford Book of Spanish Verse* (1913).

FITZPATRICK, BENJAMIN (1802-69). An American lawyer and politician. He was born in Georgia, but settled in Montgomery, Ala., where he made a reputation as a lawyer and

became known as a man of exceptional integrity in public affairs. In 1840 he was a candidate for presidential elector on the Democratic ticket and was an active worker for Martin Van Buren. He was elected Governor of Alabama in 1841. From December, 1848, to March, 1849, he was in the United States Senate by appointment to fill a vacancy caused by death; and he again served from 1853 to 1861. During part of this time he presided over the Senate as president pro tem. In 1860 he was nominated for Vice President on the ticket with Douglas, but declined to run. When Alabama adopted her ordinance of secession in 1861, he retired from the Senate, but took no active part in Confederate affairs. He was president of the Alabama Constitutional Convention of 1865.

FITZPATRICK, SIR CHARLES (1853-). A Canadian statesman and jurist. He was born in Quebec, and was educated at Quebec Seminary and at Laval University, where he graduated in 1873 and was admitted to the provincial bar in 1876. In 1876 and again in 1887 he was appointed crown prosecutor for Quebec city and district. He soon attained high rank as a criminal lawyer, in 1885 was chief counsel for Louis Riel (q.v.), and in 1892 defended Honoré Mercier (q.v.) in the prosecutions following the fall of his administration. In 1890-96 he was a Liberal member of the Quebec Legislature, and in 1896-1906 was a member of the House of Commons. During his term in the House he was Solicitor-General (1896-1902) and Minister of Justice (1902-06) in the Liberal cabinet of Sir Wilfrid Laurier. In 1906 he was appointed Chief Justice of the Supreme Court of Canada. As one of the prominent Roman Catholic laymen of his province, he took part in the movement which resulted in the appointment of a papal ablegate to Canada in 1896. In 1902 he became a member of the Royal Commission for the revision of the public statutes, and in 1908 he was appointed a British member of The Hague Peace Tribunal. His outspoken sympathy with the cause of Irish home rule had made him a delegate to the Irish Nationalist Convention in 1896, and he was also a lay delegate to the first American Roman Catholic Missionary Congress in 1908. For some years he was professor of criminal law in Laval University. On several occasions during the absence of the Governor-General Fitzpatrick was appointed Administrator of the Canadian government. In 1907 he was knighted, and in the following year he became a member of the Imperial Privy Council. Harvard University conferred upon him the degree of LL.D. in 1914.

FITZPATRICK, RICHARD (1747-1813). An English soldier and politician. He was educated at Westminster School and there began his acquaintance with Charles James Fox. In 1765 he was appointed an ensign in the First Regiment of Guards. Fitzpatrick was induced to enter politics and in 1774 was elected to the House of Commons. He was opposed to the war with the American Colonies, but went to America in 1777 when he was ordered, fought at Brandywine and Germantown, and returned to England in 1778. In 1782 he was First Secretary to the Duke of Portland, Lord Lieutenant of Ireland. A year later he became Secretary for War in the ministry of Fox and North. But he was more noted as a wit and a beau,

a gentleman of polished manners and courtly address, than as a politician. In 1796 he made a famous speech against Lafayette's imprisonment by the Austrians. He was made lieutenant general in 1798, general in 1803, and was again Secretary for War in 1806. After Pitt's death Fitzpatrick, though still in Parliament, took little interest in politics.

FITZPATRICK, WILLIAM JOHN (1830-95). An Irish author, born in Dublin. He was educated at the Catholic College in Clongowes Wood and at the University of Dublin. In 1876 he was appointed professor of history at the Royal Hibernian Academy. His works, chiefly biographical and dealing with Ireland's internal history before the Union, include: *The Life of Lord Cloncurry* (1855); *The Life, Times, and Correspondence of Dr. Doyle, Bishop of Kildare* (2d ed., 1880); *Lord Edward Fitzgerald* (1859); *The Sham Squire* (1866); *Irish Wits and Worthies* (1873); *Life of Charles Lever* (1879); *Life of Thomas N. Burke* (1886); *Daniel O'Connell, the Liberator: His Letters and Correspondence* (1889); *Secret Service under Pitt* (1892).

FITZRALPH, RICHARD (c.1295-1360). An English prelate, champion of the secular clergy against the mendicant friars. He was born at Dundalk, County Louth, Ireland, and educated at Oxford, where he became fellow of Balliol College, and chancellor in 1333. The following year he was made chancellor of Lincoln Cathedral, a little later Archdeacon of Chester, in 1337 dean of Lichfield, and in 1347 Archbishop of Armagh. He seems to have been a frequent and welcome visitor at the papal court at Avignon and met there in 1349 a delegation from the Armenians, who had applied to the Pope for aid against the Mohammedans. The Pope had required as a condition preliminary to giving his help that they abjure the 117 heresies with which they were charged, and the delegation was sent for consultation. Fitzralph took part in the negotiations and prepared an elaborate treatise, *Summa in Questionibus Armeniorum* (printed at Paris, 1511), which was believed to refute all the Armenian heresies. He also presented to the Pope at this time a petition from the secular clergy of England against the mendicant friars and was appointed to look into the matter. Returning to Ireland after 1350, he came out boldly against the friars. Between 1350 and 1356 he prepared and published a treatise on the questions at issue, *De Pauperie Salvatoris*, in seven books. In 1356 he preached so pointedly against the friars in London that they had him cited to defend himself before the Pope. He went to Avignon and preached there, before Innocent VI, a famous sermon, "Defensio Curatorum" (printed in Goldfast's *Monarchia*). He died at Avignon, Nov. 16, 1360, before the decision of the examiners was announced. In 1370 his bones were removed from Avignon to Dundalk, and pilgrimages were made to his tomb. Fitzralph was a popular preacher, and many of his sermons exist in manuscript. Consult Poole's edition of Wiclif's *De Dominio Divino* (Wyclif Society, London, 1890), where the first four books of the *De Pauperie Salvatoris* are reprinted.

FITZROY. The name of two Australian rivers. 1. The Western Australian river of this name rises in the King Leopold Mountains and, after a westerly course of 300 miles through fertile, grass-covered plains, turns to

the northwest, emptying into King Sound on the Indian Ocean (Map: Australia, Western, G 4). It was discovered in 1838 by Stokes. It is navigable for 100 miles. 2. The Queensland river is formed by the junction of the Mackenzie and the Dawson (Map: Australia, Queensland, F 7). It flows east into Keppel Bay on the Pacific coast, near the tropic of Capricorn. Ships of 1500 tons ascend to Rockhampton, 35 miles from its mouth.

FITZROY, DUKES OF. See GRAFTON FITZROY.

FITZROY, ROBERT (1805-65). A British naval officer. He was born at Suffolk, studied at the Royal Naval College, and entered the British navy in 1819. In 1828 he was put in command of the *Beagle*, employed in surveying the southern coast of South America under the orders of Captain King of the *Adventure*, and in 1831-36 he went on the *Beagle*, taking Charles Darwin, on another expedition. From 1843 to 1845 he was Governor and commander in chief of New Zealand. He was retired on half pay in 1850. In 1854 he became chief of the meteorological department of the Board of Trade. His *Weather Book* (1863) was a valuable contribution to meteorology, and he instituted a system of storm warnings. He committed suicide in 1865. He published: *Narrative of the Surveying Voyages of H. M. Ships Adventure and Beagle* (3 vols., 1839), the third volume of which is by Darwin; *Remarks on New Zealand* (1846); *Barometer and Weather Guide* (1858); *Barometer Manual* (1861).

FITZSIMMONS, HENRY (1566-1644). An Irish Jesuit. He was born in Dublin and was educated at Manchester, Oxford, Paris (where he was converted from Protestantism), and Rome. In 1592 he joined the Order of Jesuits and was shortly afterward made professor of philosophy in the Douai University. He did missionary work in Ireland (1597-99), for which he was arrested and imprisoned in Dublin Castle for five years. Released by order of James I, he went to Spain and then to Flanders, whence he visited Rome. After serving for some time as chaplain with the Imperial army in Bohemia, he returned to his native land in 1630. In 1641 he was found guilty of insurrection and had to flee to the mountains. His voluminous writings are chiefly controversial in character, upholding the Roman Catholic against the Protestant faith.

FITZWALTER, ROBERT (?-1235). An English baron, keeper of Hertford Castle. From a supporter, he became the leading opponent of King John, whom he accused of an attempt to seduce his daughter, and who banished him and plundered his estates (1213). Forced to recall him, John fought against the demands of Fitzwalter and his brother barons, but was brought to terms by the forces led by Fitzwalter, who was styled "Marshal of the army of God and Holy Church," and who compelled John to sign the Magna Charta. As one of the executors thereof, Fitzwalter was in terror of his life, was excommunicated, but bravely battled against the royal party on behalf of popular rights, even seeking aid from France. The help received proved to be a hindrance after the death of King John; but Fitzwalter continued his fight for freedom, and, though he was personally unfortunate, his party gained the day. In 1219 he turned Crusader for a year or two, but, being by this time an old man, he retired to England and found favor with Henry III.

FITZWILLIAM MUSEUM, THE. A museum of art at Cambridge University, built from the proceeds of a bequest made by Richard, Viscount Fitzwilliam, in 1816. A fine collection of books, manuscripts, paintings, and engravings, left by its founder, has since been largely added to by numerous donations and bequests, of which the most important was by Charles Brinsley Marlay, of Trinity College (June, 1912). Among the painters represented are Holbein, Rubens, Gainsborough, Hogarth, and Turner. Rembrandt's "Man with Plumed Hat," Palma Vecchio's "Venus and Cupid," and a "Venus" ascribed to Titian are three of the chief treasures. The museum building is a fine example of Grecian architecture. An archaeological museum is annexed to it, containing 600 casts from antique statues.

FIUME, fyoō'me, Croat. **RIEKA**, rê-yâ/kâ. A royal free town and the seaport of Hungary, geographically a part of Croatia, but forming, together with its adjoining territory, since 1870, a political division of the kingdom (Map: Hungary, D 4). It is picturesquely situated at the head of the Bay of Quarnero, an inlet of the Adriatic, and is about 40 miles southeast of Trieste. The views of the bay and town are beautiful, and the environs are attractive. Fiume consists of the old town built on a hill, with crooked narrow streets, and the new town stretching along the shore, with fine broad streets, handsome squares, and numerous elegant public buildings. The public garden is particularly worthy of mention. Among the edifices the most interesting are the cathedral (founded 1377), with a modern façade in the style of the Pantheon at Rome; the church of St. Vitus, a copy of Santa Maria della Salute at Venice; the Pilgrimage Church, approached by a stairway of 400 steps; the town hall, the government buildings, the Naval Academy, and the municipal theatre. There is a Roman triumphal arch, supposed to have been erected to Emperor Claudius II Gothicus. Fiume has several harbors, the largest, begun in 1872, being capable of accommodating 150 large vessels. It is protected by a breakwater 3250 feet in length, flanked by a quay nearly two miles long. The entire port is lighted by electricity.

The city, owing to the active interest shown by Hungary in this its only important seaport, has an extensive and steadily increasing commerce. In 1912, 16,513 vessels, of 3,184,120 tons, entered the port. The vessels clearing were 16,520, tonnage, 3,199,171. In 1911 Fiume's commercial fleet comprised 140 vessels, of 132,662 tons. The chief articles of import are wine, rice, tobacco, and raw jute; of export, flour, sugar, and lumber. The manufactures of Fiume are flourishing. The chief industrial establishments are the government tobacco factory, employing about 2000 persons, the large Whitehead torpedo works, an enormous petroleum refinery, a rice-shelling factory, an extensive paper mill, flour mills, saw mills, tanneries, and rope factories. The fisheries are important, those of tunny being especially rich. Fiume is fully equipped with banks, commercial unions, and industrial associations. It is administered by a governor, who is a member of the Upper House of the Hungarian Parliament. The town sends one representative to the Lower House. The chief educational institutions are the Naval Academy, a royal gymnasium, and two high schools. There is a United States

consul. Fiume with its territory has an area of 21 square kilometers (8.1 square miles). The population (commune) in 1900 was 38,955; in 1910 (census of December 31), 49,866, chiefly Italians, Illyrians, and Croats. Of the total in 1910 over 45,000 were Roman Catholics and over 36,000 could read and write. Fiume was a town of the Byzantine Empire. In the ninth century it was ruled by its own dukes. In 1471 it came into the possession of Austria and in 1779 was attached to the crown of Hungary. From 1849 to 1870 it was a part of Croatia.

FIVE BOROUGHES, THE. A term applied in old English history to Leicester, Lincoln, Nottingham, Stamford, and Derby, which the Danes held until 922, when they were reconquered together by Edward and Ethelfleda.

FIVE-FINGERS. See STARSISH.

FIVE FORKS, BATTLE OF. A battle fought, on April 1, 1865, in Dinwiddie Co., Va., 11 miles southwest of Petersburg, between a Federal force of about 25,000 under General Sheridan and a smaller Confederate force under General Pickett. Both Grant and Lee had perceived the importance of the Forks as a position from which to assail or to protect the Southside and Danville railroads, the two lines still open to Lee; and as part of his general movement by the left flank, Grant sent Sheridan's cavalry, afterward reinforced by the Fifth Corps under General Warren, to capture or drive away the Confederates stationed there. Lee meanwhile had sent forward a Confederate reinforcement of five brigades under Pickett. On March 31 Sheridan made an unsuccessful attack, but on the following day, reinforced by Warren's infantry, completely defeated the Confederates after a bloody fight lasting with little intermission throughout the day. The exact losses on either side were never ascertained, but the Confederates seem to have lost more than 5000 in prisoners alone, while the Federals lost fewer than 1000 in killed and wounded. Lee was forced to evacuate Petersburg on the morning of the 3d, and six days later surrendered his army at Appomattox. Consult: Johnson and Buel (eds.), *Battles and Leaders of the Civil War* (New York, 1887); Humphreys, *The Virginia Campaign of 1864 and 1865* (ib., 1883); Sheridan, *Memoirs* (ib., 1888); Alexander, *Military Memoirs of a Confederate* (ib., 1907); Steele, *American Campaigns* (Washington, 1909); *Official Records of the Union and Confederate Armies*, 1st series, vol. xlv.

FIVE HUNDRED, COUNCIL OF (Fr. *Conseil des Cinq Cents*). The Lower House of the Legislature established by the French constitution of the year III (1795). The constitution provided that two-thirds of the original body should be made up of members of the Convention. The Five Hundred initiated and discussed all legislation without taking action and then submitted their report to the Upper House, or Council of Ancients, which acted without discussion. On the 19th Brumaire, Year VII (Nov. 10, 1799), Napoleon dissolved the Five Hundred. See DIRECTORY: FRANCE; NAPOLEON I.

FIVE MEMBERS, THE. After the presentation of the Grand Remonstrance (q.v.), Charles I resolved to take vengeance on the leaders of the parliamentary opposition. The bold course subsequently taken by them, notably the impeachment of the bishops and the supposed intention to impeach the Queen, fixed him in this unlucky resolve. On Jan. 3, 1642, he sent

his Attorney-General, Sir Edward Herbert, before the Lords with articles of impeachment for high treason against five members of the Commons, Hampden, Pym, Holles, Strode, and Sir Arthur Haselrig—later one peer, Lord Mandeville, was included—charging them with attempting to subvert the fundamental laws of England, with inviting a foreign power to invade the kingdom, and with actually levying war against the King. The Lords were asked to sanction the arrest of the accused, but, instead of doing so, they appointed a committee to inquire whether it was according to law, and the Commons appealed to the city of London to have the trained bands in readiness. The sergeant at arms failed to secure the arrest of the accused members, and the impatient King himself undertook to take them by force. On January 4, Charles, urged on by his Queen, appeared with an armed retinue in the House of Commons and desired the Speaker to point out the culprits; but the impeached members had taken refuge in the city, whither they were soon followed by other members, who sat as a committee in the Guildhall. For the articles of impeachment presented to the Lords, consult: Gardiner, *Constitutional Documents* (2d ed., Oxford, 1899); and for discussion, id., *History of England* (New York, 1893-95), and Forster, *Arrest of the Five Members* (London, 1860).

FIVE-MILE ACT. An act passed by the English Parliament in 1665. It forbade non-conformist ministers who refused to take the nonresistance oath to come within five miles of any corporate town or borough, or of any parish in which they had taught or preached since the Act of Oblivion (unless they were traveling), under a penalty of £40 and six months' imprisonment. The act was not repealed till 1689.

FIVE NATIONS. See IROQUOIS.

FIVE POINTS. A locality of New York City northeast of the city hall, formed by the intersection of Baxter, Worth, and Park streets, formerly notorious as the haunt of low characters and criminals, now the site of Paradise Park. Improvements have completely altered the general aspect of the old Five Points; yet the streets of the vicinity still have features of considerable interest in the distinct settlements of Jews, Italians, and Chinese.

FIVE POINTS OF DOCTRINE. The topics in dispute between Calvinists and Arminians, viz., predestination, extent of the atonement, free will, grace, and final perseverance. Among the ineffectual attempts to settle the dispute were the quinquarticular controversy at Cambridge in 1594 and two conferences in 1626 in England and the Synod of Dort in Holland (1618-19.) See ARMINIANISM; DORT, SYNOD OF.

FIVES. See HANDBALL.

FIX, THEODORE (1800-46). An economist, born at Soleure, Switzerland. He went at an early age to France. He founded, in 1833, the *Revue mensuelle d'économie politique*. His chief book, *Observations sur l'état des classes ouvrières* (1846), attacked the doctrine of the right to work.

FIXED AMMUNITION. See AMMUNITION.

FIXED OILS. Oils which do not volatilize without decomposition. See OILS.

FIXING. The process in photography by means of which those portions of the sensitive silver salts that remain unaffected by light in the deepest shadow of the picture after the nega-

tive has been exposed are removed. The picture which remains is then permanently "fixed" on the negative and consists of metallic silver or silver oxide, to which the sensitive salt has been reduced by the action of the sun's light. Fixing is generally accomplished by sodium hyposulphite or potassium cyanide. The action of these substances depends upon the formation of double salts of silver with the alkali metals; these are soluble in water and are therefore readily washed away from the negative. In the daguerreotype process the picture was originally fixed on the silver plate by means of a boiling solution of gold and sodium hyposulphite, called *sel d'or*. See PHOTOGRAPHY.

FIXTURES (from *fix*, Fr. *fixer*, from ML. *fixare*, to fasten, frequentative of Lat. *figere*, to fasten). In English and American law, chattels which are so annexed or attached to the soil as to become, in legal contemplation, a part thereof. The term "land," in our legal system, comprehends not only the earth, but all the material improvements, such as houses, fences, and the like, which are permanently affixed thereto; and chattels which become so annexed lose their identity as chattels and their character of personal property and become land and real property. The general rule as to what constitutes a fixture legally immovable is that it must be either let into the earth or cemented or otherwise united to some erection previously attached to the ground, so that it would be waste to remove it afterward. But it must be remarked that a tenant may in all cases construct any erection he may make in such a manner as that it shall not become a fixture. Thus, if he erect even buildings—as barns, granaries, sheds, and mills—upon blocks, rollers, pattens, pillars, or plates, resting on brickwork, they may be removed although they have sunk into the ground by their own weight. But the mode of annexation to the freehold is not always conclusive as to its legal effect, an article like a picture or a chandelier may be secured to the wall or ceiling of a room by screws or otherwise for a merely temporary purpose without becoming a fixture, and, on the other hand, a heavy object, as a statue or monument, resting upon the ground of its own weight, but intended for the permanent improvement of the premises, may become a part of the freehold.

In general, however, there must be an actual annexation to the soil, and where that exists the article annexed usually becomes a fixture. To this rule various exceptions have been made in favor of what have been called trade fixtures, or fixtures erected by a tenant for life or for years for the purpose of carrying on a trade, and this principle has been extended by the courts to a variety of ornamental and domestic fixtures added to the premises by such a tenant. The exception does not go to the length of holding that such articles do not acquire the character of fixtures, but merely permits their removal by the tenant at or before the end of his term. If the removal be delayed beyond that time, the right is lost, and generally the same result follows the taking of a new lease by the tenant without reserving such right of removal. In the case of a life tenant such fixtures may be removed by his executor within a reasonable time after the tenant's death.

While in the United States the law governing the annexation and removal of fixtures is in general the same as in England, certain minor

details differ. For instance, the English discrimination against the removal by a tenant of buildings erected by him for agricultural purposes has been generally disregarded in the United States. It must be remarked also that the rule is different as between different parties. As between landlord and tenant, the rule favors the tenant. As between grantor and grantee and mortgagor and mortgagee, the tendency is to consider doubtful articles as fixtures. So, as between heir and executor, the basis of the rule is that the intention of the person making the attachment shall be considered in doubtful cases; and that generally where removal would cause an injury to the freehold a permanent fixture will be presumed to have been intended. An interesting question in regard to the rolling stock of railroads has received much attention from the courts. The results reached have been diametrically opposite in different States, some courts holding that the rolling stock is not a part of the road proper and would not be covered by a general mortgage of the real estate, and other tribunals deciding, on a similar state of facts, that the rolling stock would form a part of the realty. The former view has generally come to prevail. Consult Ewell, *Treatise on the Law of Fixtures* (2d ed., Chicago, 1905). See LANDLORD AND TENANT; REAL PROPERTY, and the authorities there referred to.

FIZEAU, fê'zô', ARMAND HIPPOLYTE LOUIS (1819-96). A French physicist, born in Paris. His father was a doctor and professor in the medical faculty of the University of Paris. In 1839 he began researches for a method to make permanent the pictures taken by the Daguerre process. He worked for some time with Foucault, and they separated only to have the better chance of progress in determining the velocity of light. Fizeau's apparatus won the prize of 10,000 francs in 1856 for this work and seven years later he became a member of the Academy of Sciences. His works on the velocity of light, on the interference of rays, on the dilatation of crystals, on spectroscopy, on the polarization of light, and on the speed of electricity, are to be found in the *Annales de physique et de chimie* and in the *Comptes rendus de l'Académie des Sciences*.

FJORD. See FIORD.

FLABELLUM (Lat., fan). A sort of fan whose liturgical use is of pre-Christian origin. The Apostolic Constitutions, in the fourth century, prescribed its use in the eucharist from the consecration to the communion; two deacons were to stand, one on each side of the altar, and gently wave fans of leather, linen, or peacock's feathers, to keep insects away from the chalice. Traces of a similar use in the West are found as late as the fourteenth century. Various specimens are still preserved, one magnificent specimen, adorned with pictures of saints and dating from the eighth century, in the abbey of Tournus. On certain festivals, when the Pope is carried in the *sedes gestatoria*, two private chamberlains accompany him with *flabella* of peacock and ostrich feathers, and the same custom is observed in the procession of Corpus Christi.

FLACCUS, GAIUS VALERIUS FLACCUS SETINUS BALBUS. A Roman poet who is supposed to have died about 88 A.D. Absolutely nothing is known regarding his life. He is the author of an epic poem on the Argonautic expedition, based on the poem by Apollonius Rhodius. This

work in its extant form is incomplete. The general opinion of scholars is that the work is rather a specimen of learned mediocrity than of genuine inspiration. It shows much study of Vergil. The *editio princeps* of the *Argonautica* appeared in 1472. The best modern edition is that of Bährens (Leipzig, 1875). An English metrical translation was published by one Nicholas Whyte as early as 1565. Consult: Teuffel, *Geschichte der römischen Literatur*, vol. ii, § 317 (6th ed., Leipzig, 1910); Harmand, *De Valerio Flacco Apollonii Rhodii Imitatore* (Nancy, 1898); Stroth, *Studien zu Valerius Flaccus* (Munich, 1905).

FLACCUS, MARCUS VERBIUS. A Roman freedman, teacher, and savant of the reigns of Augustus and Tiberius. He was the most learned man of his day and the tutor of the grandson of Augustus. He wrote an antiquarian work, *De Verborum Significatu*, giving in alphabetical order an explanation of little known or obsolete words and a description of old rites and customs. This valuable work was afterward abridged by Festus (q.v.) and has itself disappeared. Flaccus also compiled a calendar of Roman festivals, known as *Fasti Prænestini*, which was set up in the forum of Præneste, where fragments of it have been found. Consult: Nettleship, *Lectures and Essays*, 1st series (Oxford, 1885); Teuffel, *Geschichte der römischen Literatur*, vol. ii (6th ed., Leipzig, 1910); Schanz, *Geschichte der römischen Litteratur*, § 341 (3d ed., Munich, 1911). See FASTI.

FLACH, flâsh, JACQUES GÉOFRROI (1846-). A French historian, born at Strassburg, Alsace, and educated at the university of his native city (LL.D., 1869). He was an advocate at the Court of Appeals in Paris from 1872 to 1892 and professor at the Ecole d'Architecture from 1873 to 1874. In 1877 he became professor at the Ecole des Sciences politiques and in 1884 professor also at the Collège de France. His most important work, *Les origines de l'ancienne France* (3 vols., 1886-1904), deals with the formation, growth, and decay of the feudal system. In 1912 Flach was elected a member of the Academy. His writings include: *De la subrogation réelle* (1870); *Histoire du régime agraire de l'Irlande* (1883); *Jonathan Swift* (1886); *Etudes critiques sur l'histoire du droit romain au moyen âge* (1889); *L'Origine de l'habitation et des lieux habités en France* (1889).

FLACHAT, flâ'shâ', EUGÈNE (1802-73). A French engineer. He was born at Nîmes and received his education chiefly from his elder brother, Etienne, in association with whom he was engaged from 1823 to 1830 in elaborating the plan for a canal between Havre and Paris. After studying dock construction in England he returned to France, where he devoted himself to railroad engineering. He was chief engineer of the Chemin de Fer d'Est until 1857, when he was appointed to the same position in the Chemin de Fer du Sud. In 1848 he and others founded the Société des Ingénieurs civils de France, of which he was the first president and president in all for seven years. His principal literary productions include: *Etablissements commerciaux, docks de Londres, entrepôts de Paris* (1836); *Rapport sur le canal du Rhône au Rhin* (1840); *Les chemins de fer de 1862 et 1863* (1863); *Traité de la fabrication du fer*, with Barrault and Pefiet (3 vols., and atlas, 1842-46; Ger. trans., 1847-51); *Mémoire sur les*

travaux de l'isthme de Suez (1865); *Navigation à vapeur trans-océanique* (2 vols., 1867).

FLACIUS, flā'shī-ūs (properly **FLACH** or **VLACICH**), MATTHIAS (1520-75). A German Lutheran theologian and controversialist. Born at Albona, Illyria (and hence called Illyricus), he studied at Venice, Basel, Tübingen, and Wittenberg, and in 1544 was appointed to the chair of Hebrew at Wittenberg. Here he strongly opposed the Leipzig Interim (see **INTERIM**), and for his attacks upon Melancthon was obliged to resign his post in 1549. In 1557 he received a professorship at the new University of Jena. In a discussion with Viktorin Strigel, a member of the Jena faculty, on will as a factor in conversion, he affirmed that original sin was a portion of the substance of the present character of humanity and thus he became discredited as a Manichæan. He was removed from his professorship in 1561 and thereafter was driven from one place to another. It has been supposed that he was somewhat unbalanced; at any rate, he was dogmatic and obstinate. He is still known for his valuable work in biblical interpretation and church history, including the material prepared by him for the *Magdeburg Centuries* (q.v.), and the noteworthy *Clavis Scripturæ Sacræ* (1567). For his biography, consult Twisten (Berlin, 1844) and Preger (Erlangen, 1859-61).

FLACOURT, flā'kōōr', ETIENNE DE (1607-60). A French colonial officer and author, born at Orléans. He commanded the royal troops at Fort Dauphin, Madagascar (1648-55), and added the Ile de Bourbon to the possessions of the crown. Isolated from France, he acted on his own responsibility and exercised great severity in restoring order and putting down a rebellion among the native population. After returning to France he published three works of importance: *Petit catéchisme madécasse et français* (1657); *Dictionnaire de la langue de Madagascar* (1658); and *Histoire de la grande île de Madagascar* (1658; 3d ed., 1664). A genus of thorny shrubs common in Madagascar and in parts of Asia and Africa is called *Flacourtia* in his honor. Consult A. Malotet, *Etude de Flacourt, ou les origines de la colonisation française à Madagascar* (Paris, 1898).

FLAD, HENRY (1823-98). An American civil engineer, born in Bavaria, Germany. He was educated first at the college of Spire, Rhenish Bavaria, and after a two years' course in the School of Engineers, University of Munich, graduated as a civil engineer in 1846. He was assistant engineer on improvements to the river Rhine and other government public works until 1849, when he was elected captain of a pioneer company in the revolutionary army of Baden. The revolution failed, and he was sentenced to death, but escaped to the United States in the same year. There he rose in the engineering departments of various railways in New York and the Central Western States until in 1861 he enlisted in the Civil War, at the close of which he was a colonel of engineers. He then settled in St. Louis and became chief assistant to James P. Kirkwood, a notable hydraulic engineer. From 1867 to 1874 he was chief assistant engineer to Capt. James P. Eads on the construction of the St. Louis Bridge over the Mississippi River. From 1867 to 1875 he was a water commissioner of the city of St. Louis, and for many years after 1877 he was president of the Board of Public Improvements

of that city. He was president of the American Society of Civil Engineers in 1886. For several years before his death he was a member of the Mississippi River Commission.

FLAG (ODutch *vlagghe*, Dutch *vlag*, Dan. *flag*, Swed. *flagg*; connected with dialectic Swed. *flage*, to flutter in the wind, ODutch *flaggheren*, *vlaggheren*, to flag, droop). A cloth of light material capable of being extended by the wind and designed to make known some fact or want to spectators. In the army a flag is the ensign carried as its distinguishing mark by each regiment, and also a small banner with which the ground to be occupied is marked out. In the navy the flag is of more importance, often constituting the only means vessels have of communicating with one another or with the shore.

The records of the form of objects used as ensigns are frequently to be found among the remains of earliest civilizations. Among the Persians, Greeks, and Romans various devices were used as standards in time of war, the Roman eagle being a well-known instance of this usage. It is not, however, until the Middle Ages that anything appears which is in the modern sense a flag. Among these may be mentioned the oriflamme, the sacred banner of all France. It is well known how the banner of William the Conqueror was sent to him by the Pope. In the mediæval period the banner was not only a personal ensign, but it denoted also that he who bore it was the leader of a military force.

Among modern standards may be mentioned the Union Jack, the national flag of the British Empire, in which are combined in union the crosses of St. George, St. Andrew, and St. Patrick; and the tricolor, which is the sole flag of France. It is divided vertically into three parts of equal width.

Naturally the standard English flag was used by the American Colonies in their early days, and this was commonly the cross of St. George and later the union cross, the former consisting of a white banner with a red cross. The Puritan spirit was shown when Endecott (q.v.) cut the cross from the flag because it was a Romanist emblem and a relic of Antichrist. The Colonial flags varied in color, it being sufficient if ground and cross differed. Now and then a pine tree or a hemisphere was figured in the upper left-hand quarter of the cross, and one flag had only the tree for a symbol. When Sir Edmond Andros was Governor, he established a special flag for New England—a white field with a large St. George cross, and in the centre "J. R."—*Jacobus Rew* (James, King), surmounted by a crown. The Revolution and the pre-Revolutionary controversies brought in all manner of devices for flags and banners, the larger portion bearing mottoes more or less defiant of the British government. Soon after the fight at Lexington the volunteers from Connecticut put on their flags the arms of the Colony, with the legend *Qui transtulit sustinet* (He who brought us over sustains us). The Colonial flag of New Amsterdam (substantially the present arms of New York City) was carried by armed vessels sailing out of New York—a beaver being the principal figure, indicative of both the industry of the Dutch people and the wealth of the fur trade. A month after Bunker Hill, Putnam displayed a flag with a red ground, having on one side the Connecticut motto and on the other side the words then recognized as

the motto of Massachusetts, "An Appeal to Heaven." The earliest vessels sailing under Washington's authority displayed the pine-tree flag, though a combination of that and other flags was sometimes used. Many privateers, however, adopted a device consisting of a mailed hand grasping a bundle of 13 arrows. An early flag in the Southern States was designed by Colonel Moultrie and was displayed at Charleston in September, 1775. It was blue, with a white crescent in the upper corner next the staff; afterward the words "Liberty or Death" were added. At Cambridge, Mass., on Jan. 2, 1776, Washington displayed a flag, designed by Franklin, Lynch, and Harrison, consisting of 13 stripes of red and white, with the union jack in place of the stars, the stripes being emblematic of the union of the 13 Colonies against British oppression. The rattlesnake flag was often used, the snake being coiled to strike, and the motto, "Don't tread on me." The snake's rattles generally numbered 13.

No official action was taken with regard to a national flag until June 14, 1777, when the Continental Congress passed a resolution, "That the flag of the thirteen United States be thirteen stripes, alternate red and white; that the union be thirteen stars, white in a blue field, representing a new constellation." The origin of this design has been the subject of much controversy, which has left the subject unsettled, though perhaps a majority of writers consider the design to have been suggested by the coat of arms of the Washington family, which contains both the stars and the stripes. Paul Jones claimed to have been the first to raise the new flag over a naval vessel, and it seems that the first use of the Stars and Stripes on land was at Fort Stanwix, where a hastily improvised flag was raised over some captured British colors on Aug. 6, 1777. (See FORT STANWIX.) The flag was used at the battle of Brandywine and thereafter in all important engagements until the close of the war. On Jan. 13, 1794, Vermont having been admitted to the Union in 1791 and Kentucky in 1792, Congress enacted, "That from and after the first day of May, one thousand seven hundred and ninety-five, the flag of the United States be fifteen stripes alternate red and white; that the union be fifteen stars, white in a blue field," the intention apparently being to add both a stripe and a star for each new State admitted. In 1818, however, the number of States having increased to 20, Congress enacted that the number of stripes be reduced to 13, to typify the original 13 States; that the number of stars be increased to 20; and that "on the admission of every new State into the Union, one star be added to the union of the flag, and that such addition shall take effect on the Fourth of July next succeeding such admission." There are now 48 stars on the flag, arranged in six rows of eight each, two stars having been added in 1912 by the admission of New Mexico and Arizona. The union jack consists of the blue ground, without stripes, having the stars in white. It is used by pilots and in the bow of boats for ambassadors and ministers. During the Civil War the seceding States had a number of distinct flags. Early in 1861, however, their Congress decided upon what was popularly called the "Stars and Bars," which was composed of three broad horizontal bars, the two outer ones red and the middle one white, with a blue "union" containing seven

white stars in a circle. The number of stars was subsequently increased to 13. The Confederate battle flag used throughout the war consisted of a field of red on which was a blue St. Andrew's cross bordered with white and bearing 13 white stars. In 1863 the Confederate Congress adopted a flag having a white field with a union or canton of the battle flag. This was sometimes mistaken for a flag of truce, so in 1865 a red bar was imposed across the end of the field. See Plates under UNITED STATES.

There are many flags which designate special or official position or authority, such as royal standards, the President's flag, and the Secretary of the Navy's flag. The President's flag, which is carried at the main of naval vessels and on boats in which he embarks, is blue, with the coat of arms of the United States. The Secretary of the Navy's flag is blue and has a white fowl anchor in the centre surrounded by four white stars. The flag of the revenue marine has 16 perpendicular red and white stripes alternating. The "union" carries the coat of arms of the United States and occupies the width of eight stripes. The flags of the flag officers of the United States navy are blue, carrying white stars—four stars for the admiral and two for rear admirals. In case two or more rear admirals are in company, however, the one second in rank flies a red flag with two white stars and the junior rear admirals fly white flags with two blue stars. The commodore's flag is no longer in use, since the grade of commodore on the active list was abolished in 1899. The revenue flag, used to indicate the jurisdiction of the Treasury Department, was adopted in 1799. The flag of the Secretary of War is of scarlet bunting, having upon it an eagle with outstretched wings. Garrison, post, and storm flags are national flags made of bunting. The flag of the Geneva Convention in connection with the national flag is used for army hospitals.

When a naval vessel enters a foreign port it hoists the flag of that country and at the same time gives a salute of 21 guns. In foreign countries the royal standard is displayed at ceremonies in honor of the sovereign or at which the sovereign may be present, and it, or the national ensign of the country, is hoisted at the main of vessels aboard which such sovereign goes. When ministers, consuls, etc., leave men-of-war that they have officially visited, the flag of the nation to which they belong is hoisted at the fore upon their departure, during the firing of a salute in their honor. A flag placed at "half-mast" is a sign of mourning. A flag reversed, or with the union down, indicates distress. When saluting is done with the flag, the salutes are made by "dipping" it, usually three times, i.e., hauling it down a few feet and then running it up again. In the navy, when the flag is hoisted at "colors" or hauled down at sunset, all officers and men are required to salute it.

Flag captain, or *fleet captain*, is an unofficial title applied to the captain of the flagship. He is announced as "chief of staff" by a general order issued by a commander in chief upon taking command. A separate officer for this duty is no longer ordered in the United States navy. Consult: Preble, *History of the Flag of the United States* (Boston, 1872); for official designs to scale, *Flags of Maritime Nations* (Washington, 1899); Harrison, *Stars and Stripes and Other American Flags* (Boston, 1906); Champion, *Our Flag, 1607-1910* (4th

ed., New Haven, 1910). See Plate of NATIONAL COATS OF ARMS with HERALDRY; STORM AND WEATHER SIGNALS; NATIONAL FLAGS.

FLAG (probably ultimately identical with *flag*, banner, from its waving in the wind). A popular name for many monocotyledonous plants with sword-shaped leaves, mostly growing in moist situations. It is sometimes particularly appropriated to species of the genus *Iris*, or flower-de-luce; but is also given indiscriminately to plants of similar foliage, as the sweet flag (*Acorus calamus*) and the cat-tail reed (*Typha*). See *IRIS*.

FLAGELLANTS (Fr. *flagellant*, It. *flagellante*, from Lat. *flagellare*, to scourge, from *flagellum*, scourge, diminutive of *flagrum*, whip). The name given to certain bodies of fanatical enthusiasts, who at various intervals from the thirteenth to the sixteenth century made their appearance in different countries of Europe, proclaiming the wrath of God against the corruption of the time, inviting sinners to atone for sin by self-inflicted scourgings or flagellations, and themselves publicly enforcing this exhortation by voluntary scourging of themselves and by other forms of self-castigation. These fanatical movements recurred at frequent intervals. The most remarkable, however, are two in number. The first originated at Perugia in 1260, at a time when society in Italy was greatly disorganized by the long-continued struggles of the Guelph and Ghibelline factions and by a severe plague in 1259. The disorders of the time favored the movement, and it soon became so formidable as to draw upon itself the suspicion of Manfred, the son of Frederick II, by whom it was vigorously suppressed. Early in 1261 it had died out in Italy. Some of the flagellants appeared in Bavaria, Austria, Moravia, Bohemia, Poland, and France, when to their extravagant practices they added still greater extravagances of doctrine. In virtue of a pretended revelation, they asserted that the blood shed in self-flagellation had a share with the blood of our Lord in atoning for sin; they mutually confessed and absolved each other and declared their voluntary penances to be a substitute for all the sacraments of the church and for all the ministrations of the clergy. The Jews suffered from their fanatical fury in many of the towns of Germany and the Netherlands. The second outbreak of flagellantism originated in Germany in 1349. Its immediate occasion was the terror inspired by the plague known as the Black Death, which devastated Europe in a fearful manner during 1347-49 (consult Hecker, *Epidemics of the Middle Ages*, Eng. trans., London, 1846). These fanatics went about the country in organized bands, each member bound by an oath to render implicit obedience to the leader, to abstain from all physical pleasures, and to submit to scourgings and tortures for a period of 33 days in commemoration of the 33 years of the life of Jesus. They wore a cloak with red crosses sewed upon it and red crosses on the hat. In regular procession they proceeded from town to town and in the public places threw themselves on the ground and scourged one another, singing penitential songs and exhorting the bystanders. The movement, attended with some beneficial results at first, soon became marked by excesses. From Germany it spread to the Netherlands, Switzerland, Sweden, and even England. The flagellants were rigorously

excluded from France, but made their way into Avignon, then the papal residence, and were condemned by Clement VI. After 1350 bands of flagellants appeared only sporadically. In 1414 a new troop of flagellants, locally called *Flegler*, appeared in Thuringia and Lower Saxony under the lead of one Conrad Schmidt. They renewed and even exaggerated the wildest excesses of their predecessors, rejecting all the received religious usages and all external worship, placing their entire reliance on faith and flagellation. The violence of these fanatics drew upon them the severest punishments of the Inquisition. Nearly 100, among them Schmidt, were burned at Sangershausen in 1414, and others perished in other places. Their doctrines, comprised in 50 articles, were condemned by the Council of Constance (1414-18). Nevertheless they appear occasionally until 1454, after which year they cease to be mentioned. Independent of this movement bands of "scourgers" appeared in Spain, southern France, and north Italy towards the close of the fourteenth century, under the lead of Vincent Ferrer. They wore a long white garment, veiling head and features, and from this received the name of *albi*, white. In large companies they went through the towns, praying, singing, and scourging one another. After the Council of Constance they gradually disappeared.

On the general subject, consult: Fürstemann, *Die christlichen Geisselgesellschaften* (Halle, 1828); Cooper, *Flagellation and the Flagellants* (London, 1896); Lea, *History of the Inquisition* (New York, 1875) and *History of Auricular Confession and Indulgences* (ib., 1896); Heimbucher, *Die Orden und Kongregationen der katholischen Kirche* (Paderborn, 1897); Zöckler, *Askese und Mönchtum* (Frankfurt, 1897).

FLAGELLATA, flăj'el-lă'tă (Neo-Lat. nom. pl., from Lat. *flagellum*, whip). In zoölogy, a name often applied to the class Mastigophora (q.v.) of the order Protozoa (q.v.), but now restricted to an order of that group. In botany, a large group of organisms presenting a combination of plant and animal characters, but now thought to be most closely related to the Volvocales. (See *ALGÆ*.) The Flagellata are one-celled, active, aquatic forms, with one or two (sometimes more) cilia. The cell is naked or with a distinct membrane, and the protoplast shows contractile and amoeboid movements, and contains a nucleus, a pulsating vacuole, and in many forms distinct green or brown chromoplasts. Some of them are very animal-like in taking food, ingesting solid particles; and their usual multiplication by longitudinal splitting is not plantlike. No sexual reproduction is known, but the frequent formation of thick-walled resting spores is suggestive of plants. It has been suggested that the Flagellates may be regarded as the starting point for one-celled plants (as Volvocales) on the one hand and for such animals as the Protozoa on the other.

FLAGELLATES. See *FLAGELLATA*.

FLAGELLATION. An ecclesiastical punishment which has been used from the fifth century on clerical, monastic, and lay individuals. As a means of self-discipline and aid in attaining the heights of ascetic piety, it found early use in the religious communities. The Roman Catholic church holds the lawfulness, and even the meritorious character, of voluntary self-chastisement, if undertaken with due dispositions, practiced

without ostentation or fanaticism, and animated by a lively faith and a firm hope in the merits of Christ (cf. 1 Cor. ix. 27; Col. iii. 5). This is the self-castigation known under the name of "the discipline" and has been encouraged, under ecclesiastical guidance, by the Jesuits in various countries. This, however, has no connection with the flagellants (q.v.) of earlier ages.

FLAGELLUM DEI (Lat., The Scourge of God). A title given to Attila, King of the Huns.

FLAGEOLET, flaj'ô-lèt (OF., Fr. *flageolet*, dim. of OF. *flageol*, Prov. *flaujol*, flute, from ML. **flautiolus*, little flute, from *flauta*, flute, from Lat. *flatus*, blast, from *flare*, to blow). A wind instrument of the flute family. It was made of boxwood or ivory, in several pieces, and had holes for the fingers, like the flute. Its compass was from *g*¹ to *b*[♭], and the tones sounded a fifth higher than written. The flageolet differed from the flute in so much that it had a mouthpiece and was also played in a vertical instead of horizontal position. The character of the tone was somewhat similar to that of the ordinary flute, but more mellow. The instrument is not used in the orchestra to-day. Mozart employed it, but since his time no other composer has made use of it. See FLUTE.

FLAGEOLET TONES. An obsolete name for harmonics (q.v.).

FLAGET, flá'zhá, BENEDICT JOSEPH (1763-1850). A bishop of the Roman Catholic church in America. He was born in Contournat, Auvergne, France, and was educated at the College of Billom and at the College of the Sulpicians at Clermont, becoming a member of that order in 1783. He was ordained a priest in 1788 and held a professorship of dogmatic theology at the University at Nantes and at the Sulpician Seminary at Angers. In 1792 he was compelled to flee from France and settled in America, first at Baltimore, and later as chaplain at the military post of Vincennes, in the newly organized Northwest Territory. In 1795 he returned East and accepted a professorship in Georgetown College, where he remained three years. In 1798 he went to Havana, returning in 1801 with 21 Cuban students to be educated at Georgetown, where he resumed his professorship. In 1808 he was appointed Bishop of Bardstown (Ky.), with an extensive diocese that reached from the Alleghanies to the Mississippi and from the Great Lakes southward to the thirty-fifth parallel. He spent the years 1808-10 in Europe and was consecrated on his return in the latter year. He entered upon his duties in the face of great difficulties with remarkable energy; and his exertions were crowned with unusual success. He resigned his see in 1829, but was persuaded to withdraw his resignation. By 1834 he had erected four colleges, an orphan asylum for girls, 11 academies for girls, and had introduced into his diocese three religious sisterhoods and four religious orders for men. He spent the years 1835-39 in Europe. In 1841 the seat of his diocese was removed to Louisville, where his activities continued until his death.

FLAGFISH. A coral fish (*Heniochus macrolepidotus*) of Japanese and Philippine waters, so called from the fancied resemblance of its slender erectible dorsal fin to a flagstaff. See Colored Plate of PHILIPPINE FISHES.

FLAGG, ERNEST (1860-). An American

architect, born at Brooklyn, N. Y. After studying at the Ecole des Beaux-Arts, Paris, under Blondel, he became a practicing architect in New York City in 1891. He was architect of St. Luke's Hospital, New York, the Corcoran Gallery of Art, Washington, the United States Naval Academy, Annapolis, Md., the Singer Building, New York, and other important buildings. He is also author of many magazine articles on model tenements, roads, and pavements.

FLAGG, GEORGE WHITING (1816-97). An American historical and genre painter. He was born at New Haven, Conn., and studied in Boston under his uncle, Washington Allston. His picture "The Murder of the Princes" (New York Historical Society) attracted the attention of Lumen Read, who enabled him to study for three years in Italy. Later he spent three years in London, and after his return to America he was elected (1851) to the National Academy of Design. Flagg painted historical compositions, sentimental single figures, and ideal heads with a certain skill and feeling; but although his paintings are harmonious in color, they are without enduring merit. He is best represented in the New York Historical Society, which possesses 13 of his paintings, including "The Execution of Lady Jane Grey" and the "Little Match Girl." His painting "Washington Receiving his Mother's Blessing" is widely known through engravings.

FLAGG, ISAAC (1843-). An American classical scholar, born at Beverly, Mass. He graduated in 1864 from Harvard University (where he was tutor in Greek in 1865-69), and studied at the universities of Berlin and Göttingen (Ph.D., 1871). He held the professorship of Greek at Cornell University in 1871-88 and was associate professor of classical philology and Greek at the University of California from 1891 to 1909, when he became professor emeritus. He edited: *The Hellenic Orations of Demosthenes*; *The Seven against Thebes of Æschylus*; *Iphigenia among the Taurians* of Euripides; the *Lives of Cornelius Nepos*; Plato's *Apology* and *Crito*. Besides *Versicles*, *Hylêthen* (1896), and other poems, he is author of *Outline of the Temporal and Modal Principles of Attic Prose* and *A Writer of Attic Prose* (1902).

FLAGG, JAMES MONTGOMERY (1877-). An American illustrator, portrait painter, and author. He was born at Pelham Manor, N. Y., and studied at the Art Students' League, New York City, at Herkomer's Art School, Bushey (England), and under Victor Marec in Paris. At the age of 14 he published his first drawing in *Life*. An illustrator for numerous magazines, he also wrote (and illustrated) a number of volumes—poetry and prose—of which the best known are: *Tomfoolery* (1904); *If: A Guide to Bad Manners* (1905); *Why They Married* (1906); *All in the Same Boat* (1908); *City People* (1909); *I Should Say So* (1914). Flagg was early recognized as a keen observer, a facile and able technician, and a faithful portrayer, with great fertility of ideas and inexhaustible humor. His work in charcoal, crayon, pen and ink, and oils shows equal proficiency in these mediums. One of his best portraits in oil is that of Mark Twain, in the Lotus Club, New York.

FLAGG, JARED BRADLEY (1820-99). An American painter and clergyman, born in New

Haven, Conn. He studied art under his brother, George Whiting Flagg, and his uncle, Washington Allston, and practiced in New Haven as a portrait painter before his removal to New York in 1849. He was elected to the Academy of Design in 1850, but became a clergyman in the Episcopal church in 1854, and was for eight years rector of Grace Church, Brooklyn Heights, N. Y. Though Dr. Flagg painted mildly sentimental figures, notably "Hester Prynne in Prison," portrait painting was his specialty. His portraits of William M. Evarts (1887) and Chief Justice Church hang in the State Capitol at Albany. Among his other portraits were that of Commodore Vanderbilt, exhibited at Philadelphia in 1876, and of John Jay. He published *Life and Letters of Washington Allston* (1829).

FLAGG, WILSON (1805-84). An American naturalist, born at Beverly, Mass. After three months of residence at Harvard he studied medicine, which he never practiced, and later became a contributor to the *Weekly Magazine*, the *Post*, and the *Atlantic Monthly*, all of Boston. He at first wrote on politics, but soon turned his attention to natural history and particularly to ornithology. In 1844-48 he was connected with the customhouse of Boston. His publications include: *Analysis of Female Beauty* (1834); *Studies in the Field and Forest* (1857); *The Woods and Byways of New England* (1872; reprinted as *A Year among the Trees*, 1881); *Birds and Seasons of New England* (1875; reprinted in 3 vols. as *A Year with the Birds*, 1889).

FLAGLER, HENRY M. (1830-1913). An American capitalist, born at Canandaigua, N. Y. He was for a time a clerk in a country store, then a manufacturer of salt in Saginaw, Mich., and later a member of the firm of Rockefeller, Andrews, and Flagler, Cleveland (Ohio) oil refiners. After this firm was succeeded by the Standard Oil Company he was long prominently connected with this corporation; he resigned his vice presidency in 1908 and his directorship in 1911. As the builder and owner of the Alcazar and Ponce de Leon hotels, St. Augustine, Fla., he did much to make that city a popular winter resort. He was also chairman of the board of directors of the Florida East Coast Railway and director of the Western Union Telegraph Company, the Pennsylvania and Occidental Steamship Company, and the Cuba Company.

FLAG OFFICER. In the United States navy, an officer entitled by his rank to carry at the masthead a flag instead of a pennant, indicative of his command. At present the flag officers' are admirals, who carry the flag at the main, vice admirals, who carry it at the fore, and rear admirals, who carry it at the mizzen. In case a ship has but two masts they are called the fore and main; the flag of a rear admiral is then hoisted at the main. (For admiral's flag, see Colored Plate of FLAGS, UNITED STATES.) Previous to the abolition of the grade of commodore (q.v.), officers of that rank were included among the flag officers. See ADMIRAL.

FLAG OF THE PROPHET (Ar. *sinjaq sharif*, noble standard). The sacred banner of the Mohammedans. It was originally of a white color and was composed of the turbans of the Koreish, captured by Mohammed. A black flag was, however, soon substituted in its place, consisting of the curtain that hung before the door of Ayesha, the favorite wife of the Prophet.

This flag, regarded by the Mohammedans as their most sacred relic, was first held by the successors of Omar at Damascus; it afterward fell into the hands of the Abbassides, caliphs of Bagdad, and at a later period was brought into Europe by Amurath III. It was covered with 42 wrappings of silk, deposited in a costly casket, and preserved in a chapel in the interior of the seraglio, where it is guarded by several emirs, with constant prayers. The banner unfolded at the commencement of a war, and likewise carefully preserved, is not the same, although it is believed by the people to be so.

FLAG OF TRUCE. A white flag exhibited by one of two contending forces, indicating a desire to communicate. The necessity of occasionally communicating with the enemy in time of war, and the fact that this can usually be best done by means of a flag of truce, has given to the latter a sort of sacred character, which is recognized by all civilized people and by many savages as well, and a violation of the recognized immunities of the flag and of its bearers is regarded as just ground for retaliation and punishment. The immunities of the bearer are not, however, absolute. If it appear during an engagement, firing need not terminate, and if the bearer or a person accompanying him be killed or injured, there is no ground for complaint. Deliberate firing upon a party bearing a flag of truce, unless they have been warned not to proceed, is regarded as a breach of the military or naval code. A flag of truce, to have the ordinary immunity, must be sent by the senior officer present, and it can only be received at the will of the senior officer of the other side. In a naval battle the vessel bearing it should not attempt to proceed beyond a point at which her character can be easily ascertained; should she attempt to go farther she may be warned by a shot across her bow, and if she does not then stop she will be fired into. Having been warned to stop, she must then await the pleasure of the enemy; if he declines to communicate, she must perforce retire, but this is unusual. The detention of a flag of truce beyond the lines is a protection to the receiving side against espionage, torpedo attack, etc. Any attempt to obtain information of the enemy's position, condition, or force through a flag of truce may subject the bearer to trial as a spy. In any case he may be detained as a prisoner if the receiver deems it desirable. In dispatching a flag of truce, except during an engagement, the flagship of the senior officer should keep her colors flying and a white flag at the fore; and if the senior officer of the enemy receives the flag bearer, his ship should do likewise during the progress of the conference, and afterward until the flag-of-truce boat has reached its own lines. The boat carrying the flag should be met at the proper point by one in charge of an officer of suitable rank from the other senior officer, which should fly a white flag while going and returning.

FLAGSTAFF. A town and the county seat of Coconino Co., Ariz., on the Santa Fe Pacific Railroad (Map: Arizona, D 2). It is situated 6935 feet above sea level and is south of the San Francisco Mountains, one of which, San Francisco Peak (12,800 feet), is of particular interest, being an extinct volcano. The Northern Arizona Normal School is here, and to the northwest of the town is the Lowell Observatory. Flagstaff has extensive live-stock and lumber

interests and a trade in Indian curios and Navajo blankets. A railroad extends from the vicinity of the town to the Grand Cañon of the Colorado. The town owns its water-works system, costing \$300,000. Pop., 1900, 1271; 1910, 1633.

FLAGSTONE (*flag*, Icel. *flaga*, slab, from *flagna*, to flake off + *stone*, AS. *stān*, Icel. *steinn*, Ger. *Stein*, stone). A rock which splits into tabular masses, or flags, of various sizes and thickness, along the original planes of stratification. Flagstones are generally sandstones, containing more or less argillaceous or calcareous matter; some, however, are indurated clays and others thin-bedded limestones. They are used for pavements, cistern linings, etc. Blue-stone is a variety of sandstone of Devonian age found in New York, Pennsylvania, and New Jersey. It forms the basis of a large industry. Other formations yielding flagstones are the Carboniferous of Ohio and Pennsylvania, the Triassic brownstone of Connecticut, and the Hudson River and Potsdam formations of New York. Consult Ries, *Building Stones and Clay Products* (New York, 1912).

FLAHAUT DE LA BILLARDERIE, flà'-ô de là bë'yür'drè', AUGUSTE CHARLES JOSEPH, COMTE DE (1785-1870). A French soldier and diplomat, born in Paris. His father, intendant of the Royal Garden (1792), was guillotined in 1793, and his mother, later the Marquise de Souza, took him to England. He returned in 1798, accompanied Napoleon into Italy, and was made lieutenant at Marengo. In 1811 Queen Hortense, with whom he had a liaison, gave birth to the Duc de Morny. In 1813 he became general of division, and afterward Napoleon appointed him to treat for peace with the Allies; but this task was too much for Flahaut's diplomacy. After the Emperor's return from Elba he fought under him at Waterloo, and upon the French defeat upheld Napoleon's son, the King of Rome, went to England as an exile, and married there Lady Keith, a peeress in her own right, and did not return to France until 1827. The revolution of 1830 restored him to his titles. He was made Minister Plenipotentiary to Berlin in 1831; from 1841 to 1848 was Ambassador to Vienna. He was one of the ministers who drew up for Louis Napoleon the constitution of 1852; and under the Second Empire he was Senator (1853) and Grand Chancellor of the Legion of Honor (1864). From 1860 to 1862 he was Ambassador to the Court of St. James's. Consult A. de Maricourt, *Madame de Souza et sa famille* (Paris, 1907).

FLAIL. See **THRESHING**.

FLAMBARD, RANULF (?-1128). Bishop of Durham in the time of William II and Henry I. He was a Norman of humble origin who took holy orders and became chaplain to William Rufus, who in 1099 made him Bishop of Durham and one of his principal advisers. To obtain money for the King he resorted to oppressive measures which earned him the hatred of the people. His extortions were so flagrant that a plot was formed against his life; but the conspirators quarreled, and the Bishop was spared. As soon as William died Henry I sent Flambard to the Tower. He escaped and fled to Normandy, where he instigated Duke Robert to an invasion of England and accompanied the Duke on the expedition. Later he was pardoned and restored to the bishopric of Durham.

Thenceforward Flambard appears to have led a more edifying life, devoting himself to important architectural works. Consult: Stubbs, *Constitutional History of England*, vol. i (Oxford, 1897); Freeman, *William Rufus* (ib., 1882); Rounds, *Feudal England* (London, 1895); Davis, *England under the Normans and Angevins* (ib., 1905).

FLAMBOROUGH HEAD. A promontory of the Yorkshire coast, England, extending into the North Sea. It forms the north boundary of Bridlington Bay, terminating in a range of perpendicular chalk cliffs, 6 miles long, 300 to 450 feet high, which are being constantly washed down by wave attack (Map: England, G 2). It contains many caverns and outlying picturesque rocks, which swarm with sea fowl. On the head is a lighthouse, 85 feet high, standing 214 feet above sea level, its light visible 25 miles. At the centre of the promontory is the village of Flamborough. Across the peninsula, ending in the head, runs an early British intrenchment, with two lines of breastworks, called Dane's Dike.

FLAMBOYANT (Fr. *flamboyant*, pres. part. of *flamber*, to flame, OF. *flamber*, *flamer*, from Lat. *flammare*, to flame, from *flamma*, flame; connected with *flagrare*, to blaze, Gk. *φλέγειν*, *phlegein*, to burn, Skt. *bhṛā*, to be bright, AS. *blāc*, shining, pale, Icel. *bleikr*, pale, Eng. *bleak*). The name given to the latest style of Gothic architecture in France. It prevailed there during the fifteenth and early sixteenth centuries and corresponds to the Perpendicular (q.v.) in England. The name is derived from the flame-like forms of the tracery which replaced the earlier geometric tracery with its circles and triangles and which appears not only in windows, but also on wall surfaces, buttresses, choir screens, and woodwork. Other characteristics are the minuteness and intricacy of all the carved ornament; the multiplication of subordinate decorative buttresses and pinnacles; the use of flattened elliptical or subraised arches; the ogee-formed drip moldings over all kinds of arches, running up into extravagantly long finials; the tall and slender bases; the exuberance of minute tabernacle canopies and pinnacles, and the treatment of the moldings. These last abound in broad, shallow hollows, separated by narrow fillets and sometimes filled with naturalistic vine foliage. Special delight was taken in making diverse moldings cross and intersect. Capitals are often omitted from the piers, and the arch moldings are allowed to "die" into the piers or carried without interruption down to the ground or to the pier bases. The vaulting is sometimes, though not often, provided with decorative ribs and ridges; never, however, approaching the type of the contemporary English fan vaulting (q.v.). The effect is intricate rather than beautiful, suggestive, like the rest of the style, of ingenuity in stone cutting rather than vigor of design, and, in spite of great richness of detail in parts, the general effect is often thin and cold. The most successful examples of the style are apt to be minor works, like choir screens and inclosures (Amiens, Chartres, Brou, Aubi), pulpits (Strassburg), and choir stalls. There are many large buildings in France executed in this style; the most remarkable are Saint-Maclou at Rouen, Saint-Jacques at Dieppe, Saint-Riquier near and Saint-Wulfrand at Abbeville, the west façades of the cathedrals of Rouen,

Tours, and Troyes, the Palais de Justice at Rouen, and the church of Brou. Some of the spires of this period are also very beautiful; the northern spire of Chartres Cathedral is one of the finest in France. In England, also, Flamboyant tracery was introduced at the close of the Decorated period, but was so quickly superseded by the Perpendicular style that it did not form a separate style; it is there called "flowing," or "curvilinear," and can be seen at Lincoln (south transept), Ely (south aisle and triforium), Carlisle, and Wells. The corresponding stage of Gothic development in Spain, Germany, and the Netherlands is rather merely florid than based upon any clear principle of design, such as the Flamboyant.

FLAME (OF. *flambe*, Fr. *flamme*, Portug. *flamma*, from Lat. *flamma*, flame). An incandescent gaseous mixture usually produced by the chemical combination of various combustible substances with the oxygen of the air. A flame generally consists of several parts, differing from one another in temperature, color, illuminating power, etc. The flame of a lamp or candle, or simple gas jet, consists of a hollow cone, in the centre of which there is no combustion. The central space appears dark only by contrast with the luminous cone which surrounds it. It consists, in reality, of colorless substances which are constantly rising into the flame. If a glass tube, open at both ends, be held obliquely in the flame of a candle, with its lower extremity in the dark central space above the wick, it will conduct away a portion of the combustible vapor, which may be kindled like a gas jet at its upper end. The inner cone is enveloped by a bright luminous area in which the processes of chemical combination are more energetic, and which furnish most of the light yielded by the candle. The luminous cone is in its turn surrounded by an envelope emitting but little light and having a yellowish color; this part of the flame consists of a mixture of the products of combustion with air, all heated to incandescence.

Temperature. The temperature of a flame (usually about $2000^{\circ}\text{C.} = 3632^{\circ}\text{F.}$) depends mainly on the heats of combustion of the burning gases and the specific heats of the products of combustion. The amounts and the specific heats of other gases that may be present likewise exert their influence on the temperature of the flame, part of the heat of combustion being consumed in raising the temperature of such gases; thus, the temperature of a gas burning in pure oxygen is considerably higher than that of the same gas burning in air, owing to the presence of cold nitrogen in the latter. Part of the heat of combustion is also lost in the decomposition of carbonic acid in the flame. At elevated temperatures carbonic-acid gas partly dissociates into carbonic oxide and oxygen, according to the following equation:

The degree of dissociation is the greater, the higher the temperature and the lower the pressure of carbonic acid during the process. Since the ordinary illuminants contain a high percentage of hydrogen, the amount of carbonic acid produced during their combustion is relatively small; or, in other words, the partial pressure of carbonic acid in the flame is low and

its degree of dissociation is correspondingly high, as much as one-tenth of the carbonic acid being often broken up according to the above reaction. The amount of sensible heat thus consumed is therefore very considerable.

Luminosity and Color. The luminosity of flames, such as those obtained by burning coal gas or a candle, is due mainly to the incandescence of the carbon particles produced by the chemical decomposition of the combustible gases. If enough air is mixed with the latter previous to their entering the flame, complete combustion takes place as soon as the hot part of the flame is reached; there is, consequently, no separation of solid carbon, and the flame is practically nonluminous throughout. This is the principle of the well-known Bunsen burner. That solid carbon exists in an ordinary luminous flame may be readily shown by holding in it a glass rod or a piece of white porcelain, a coating of carbon being then deposited in the form of soot. A certain amount of light, however, is also produced by the incandescence of the gases themselves; this amount of light emitted is proportional to the capacity of the gases for absorbing the same kind of light at the temperature of the flame. The luminosity of a flame depends greatly on its temperature and increases even more rapidly than the latter; the luminosity of ordinary flames is considerably diminished by the dissociation of carbonic acid, since the dissociation causes a fall of temperature. Another one of the factors determining the luminosity of a flame is the density of the medium in which combustion takes place, an increase of density usually causing a corresponding increase of luminosity. Thus, in air kept under a constant pressure of about 10 atmospheres, hydrogen burns with a bright flame; on the contrary, under sufficiently diminished pressures a candle may burn with a pale, nonluminous flame. The size of a flame depends on the pressure, the temperature, and the diffusibility of the reacting substances, on the form of burner used, etc.

The color of a flame is determined mainly by the nature of the substances that may be introduced into it. Thus, sodium imparts to a flame a bright yellow color, potassium a characteristic violet color, copper usually a green color, strontium a crimson color, etc. Many chemical substances may be identified by introducing them into the colorless flame of a Bunsen burner, the color imparted to the flame often revealing the nature of the substance. The luminosity of flames artificially colored by the introduction of foreign substances is usually slight. For use in polariscopic measurements, in which a strong light of a single color (monochromatic light) is required, Rosanoff has devised a burner by which an intensely luminous flame is produced through the addition of small amounts of oxygen to the air used in the combustion, while the required color of light is produced, as usual, by the introduction into the flame of common salt (yellow light) or some similar substance.

FLAMEL, flāmél', NICOLAS (c.1330-1418). A French calligrapher, who was supposed to have succeeded as an alchemist. He was born probably at Pontoise, but practiced his craft in Paris, where he became legal writer to the University. His school for the teaching of penmanship, illuminating of manuscripts, etc., flourished, and he may have been a money lender as well as teacher and scrivener. At any

rate, he gained great wealth, part of which he distributed in ostentatious charity, while part he used in building a house of highly decorated exterior, afterward known as "l'hostel Flamel," opposite the church of Saint-Jacques-de-la-Boucherie. He wrote two treatises on alchemy, but it was largely because of his wealth, evident but unexplained to the popular mind, that he was credited with the power of turning a baser metal into gold. Fact and fiction about him were first definitely disentangled by Abbé Vilain in his *Histoire critique de Nicolas Flamel* (Paris, 1761). Consult also Didot, *Biographie générale* (Paris, 1856).

FLAMENG, flām'ān', FRANÇOIS (1856-). A French portrait and historical painter, born in Paris. He was the son and pupil of Léopold Flameng and afterward studied painting under Cabanel, Laurens, and Hédouin. In 1879 he exhibited "The Girondins Summoned," which created much comment. This ambitious work was followed by "The Conquerors of the Bastille" (1881, Rouen Museum); "Marie Antoinette on her Way to the Scaffold" (1885), and a series of graceful and gallant court scenes from the time of Louis XV, the Directorate, and the First Empire. He also painted two large battle scenes, "The Charge at Waterloo" (1898) and "Eylau" (1902, Luxembourg), in which the minuteness of detail detracts from the interest of the whole. A popular portraitist, Flameng often imitates the theatrical backgrounds and style of Nattier, but is at his best in his mural paintings in the Opéra Comique, Paris, and on the stairway of the Sorbonne, consisting of seven subjects from the history of that institution. He became an officer of the Legion of Honor, a member of the Institute, and professor at the Ecole des Beaux-Arts.

FLAMENG, LÉOPOLD (1831-1911). A French line engraver and etcher, born in Brussels of French parentage. He was the pupil of Calamatta and Gigoux in Brussels, and then went to Paris (1853), where he at first attempted original etching, but without success. In 1859 he began his connection with the well-known journal, the *Gazette des Beaux-Arts*, which established his reputation as one of the foremost engravers and etchers of the day. The most remarkable feature of Flameng's plates is the facility with which he interprets artists working in every style and all kinds of pictures, ancient or modern, always using the medium best adapted to the particular subject. Among his finest plates are: "The Death of the Virgin," after Martin Schoen; "The Charge of the Artillery," after Schreyer; "Phryne," after Gérôme; "Miss Graham," and the "Blue Boy," after Gainsborough; "The Source," after Ingres; "The Hundred Florin Piece" and the "Night Watch," after Rembrandt; the "Death of Sainte Geneviève," after Laurens. His other works include 40 etchings for Blanc's *Œuvre complet de Rembrandt* (1859), and 32 etchings for the *Théâtre complet de Molière* (1876-83), after Louis Leloir. Flameng received the medal of honor in 1886, the first prize in 1900, and was named officer of the Legion of Honor in 1894. See Plate of SHAKESPEARE.

FLAMENG, MARIE AUGUSTE (1843-93). A French landscape and marine painter, born at Jouy-aux-Arches, near Metz. He studied under various masters, ending with Delaunay and Puvis de Chavannes, and began to exhibit in 1870. After 1874 he devoted himself to marines. His

"Fishing Boat at Dieppe" (1881), in the Luxembourg, is a good example of his vigorous, fresh treatment of sea subjects. Among his other paintings are: "Fishing Boats" (Museum, Nancy); "Loading Oysters at Cancale" (Toul); "The Dock of the Messagerie Maritime at Bordeaux" (Mülhausen).

FLAMENS (of doubtful origin). In the ancient Roman religion, sacrificial priests, each of some special divinity. They were sometimes chosen for life, sometimes annually; sometimes were attached to *collegia*; sometimes, especially outside of Rome, were independent. The most important were those attached to the College of Pontifices, originally 15 in number, of whom 12 (*flamines minores*) were plebeians and seem early to have been neglected, as the names of only 9 or 10 are known. The remaining three (*flamines maiores*, or simply *flamines*) were always patricians, and were the *flamen Dialis*, *flamen Martialis*, *flamen Quirinalis*. All of these were bound by a strict ceremonial, which for a long time prohibited them from holding any other office; and, though this rule was relaxed from about 200 B.C., permission to hold military command or to be absent from Italy was never granted to the *flamines Diales* and only very late to the others. The *flamen Dialis* (of Jupiter) was bound by very strict regulations. He could not take an oath, mount a horse, see an army, or even any one at work; he must keep carefully aloof from all impurity, and must always wear his official dress, fastened with brooches, for no knot was allowed; on his head he must have the *pilleus*, a pointed cap, on the top of which an olive twig was fastened by a fillet of wool. He was also forbidden to pass a night away from his house. His wife, the *flaminica*, a priestess of Juno, was bound by similar restrictions, and in case of her death the *flamen* was obliged to resign. (Consult Aulus Gellius, *Noctes Atticæ*, x, 15.) These restrictions were accompanied by privileges—the curule chair, the *toga prætexta*, the attendance of a lictor, and a seat in the Senate. A prisoner who entered the house of the *flamen Dialis* was at once freed from his chains, and he who touched his knee could not be executed on that day. The office was found so burdensome that during the last century of the Republic it remained unoccupied for 75 years. The *flamines* were installed in the Comitia Calata and were chosen by the *pontifex maximus* from three candidates nominated by the *pontifices*. Other *flamines* were the *flamines curiales*, *flamines divorum* for the worship of the emperors, and the *flamen arvalium*, belonging to the Arval Brothers (q.v.). The *flamines* offered daily sacrifices; on October 1 the three *flamines maiores* sacrificed on the capitol to *Fides Publica*. Consult: Marquardt, "Römische Staatsverwaltung," in *Handbuch der römischen Altertümer* (Leipzig, 1885); Jullian, in Daremberg and Saglio, *Dictionnaire des antiquités grecques et romaines* (Paris, 1896); Greenidge, *Roman Public Life* (London, 1901); May, *Revue des études anciennes*, vii (Paris, 1905); Frazer, *The Golden Bough*, i, 242 ff. (2d ed., London, 1911).

FLAMINGO (Portug., older form *flamengo*, Sp. *flamenco*, from Portug. *flamant*, *flambant*, OF. *flaman*, *flambant*, Fr. *flamant*, *flamingo*, flaming, pres. part. of Portug. *flamar*, OF. *flamer*, to flame, from Lat. *flamma*, flame; influenced in popular etymology by Portug. *Flamengo*, Sp. *flamenco*, Fr. *Flamand*, Fleming).

One of a group of water birds of remarkable appearance, having a geoselike body mounted upon long legs and surmounted by an extremely long and flexible neck, terminated by a huge beak of very unusual shape. (See Colored Plate of WADING BIRDS.) Six or eight species or forms are recognized, forming the family Phœnicopteridæ, all more or less rose red in color and inhabiting the warmer parts of the world. They gather in flocks upon marshes and river banks, and in migration fly like geese, in long strings, or a wedge formation, their legs trailing behind

BEAK OF AMERICAN FLAMINGO.

and their necks stretched straight out ahead. The great length of the neck is due not to an extraordinary number (18) of bones, but to the unusual length of each vertebra. Measured from beak to toes, their matured length may exceed six feet, but as the legs, which are naked far up to the thigh, are only about two feet long, and the body is small, the apparent size is much less.

The food of these quaint birds is derived from the water and mud, and in seeking it they wade about in shallow places, supported upon the soft mud by their great webbed feet, which are kept in motion to disturb the bottom and stir out its lurking contents. The bill is large, deeper than broad, and suddenly curved downward near the middle, so that, as the bird wades and seeks its food, either in the water or in the mud, it makes use of the bill in a reversed position, the upper mandible being lowest. The edges of both mandibles are furnished with small and very fine transverse laminae, which serve, like those in the bills of the ordinary marsh duck, to prevent the escape of the small crustaceans, mollusks, worms, small fishes, seeds, etc., which are the flamingo's food, and to separate them from the mud with which they may be mingled. The upper surface of the tongue is also furnished on both sides and at the base with numerous small flexible horny spines, directed backward. Flamingos make their nests gregariously in marshes, scraping up a heap of mud, the top of which is hollowed out and contains one or two white eggs. Many fables remain in the old books as to these nests, but the truth is that the heaps of mud are only of such a height as will lift the eggs well above the surrounding water, and that the female sits with her legs folded comfortably beside her. Their favorite breeding places are salt lakes and marshes, such as the broad *marasmas* of Spain and the great Atacama saline marshes in South America.

The flamingo of the Mediterranean region (*Phœnicopterus antiquorum*) ranges far eastward and southward, and the three other species, so called, of southern Africa and southeastern Asia, may prove to be mere varieties of it. A species is peculiar to Chile, and another (distinguished by the absence of a back toe) to the elevated desert of Atacama, on the border of Chile and Bolivia. The North American fla-

mingo (*Phœnicopterus ruber*), once common in all the southern United States, but now grown very rare north of the Bahamas, West Indies, and Central America, is remarkable for the deep vermilion color of its plumage, set off by black wing quills, which has made it too attractive to sportsmen and plume hunters. The males show the brightest plumage, the young being brown and the females pale pink.

The classification of these birds has been a puzzle to ornithologists, but they are now regarded as a family representing a distinct order (Odontoglossæ or Phœnicopteriformes) usually ranked as intermediate between the anserine birds and the spoonbills, ibises, etc. Consult: Newton, *Dictionary of Birds* (New York, 1893-96); Cory, *Birds of the Bahamas* (Boston, 1880); A. Chapman, *Wild Spain* (London, 1893); F. M. Chapman, *Camps and Cruises of an Ornithologist* (New York, 1908).

FLAMINGO FLOWER. See ARUM, and Plate of ANEMONE.

FLAMINIAN WAY (Lat. *Via Flaminia*). The great northern road of ancient Italy, leading from Rome to Ariminum (Rimini) on the Adriatic. It was constructed by C. Flaminius during his censorship (220 B.C.) and was designed to secure a free communication with the recently conquered Gallic territory. The Flaminian Way was one of the most celebrated and most frequented roads of Italy during the period of the Republic and also of the Empire. Leaving Rome by the Porta Flaminia (near the modern Porta del Popolo), it crossed the Tiber at the famous Milvian Bridge (*Ponte Molle*) and ran nearly due north, crossing the river again near Borghetto, till it reached Narnia (Narni). At this point the original road continued to the northeast by way of Mevania (Bevagna) to Forum Flaminii. A branch was later built to the east, passing through Interamna (Terni) and Spolegium (Spoleto), and meeting the main road at Fulginium (Foligno), south of Forum Flaminii. From this point the road ran north and northeast through the Apennines till it reached the Adriatic at Fanum Fortunæ (Fano), where it followed the coast line to Ariminum (Rimini), where it ended, or rather where the name ceased; for the *Via Æmilia* (see *ÆMILIAN WAY*; *EMILIA*) was a continuation of it. The whole length of the road from Rome to Ariminum was, according to the Jerusalem itinerary, 222 miles and, according to the Antonine, 210 miles. The road was kept in good repair, especially by Augustus and Trajan. Important remains of this road—pieces of the pavement and arches of bridges—still exist at various places.

FLAMINI'NUS. A cognomen of an illustrious branch of the patrician Quinctia gens in ancient Rome, the most famous members of which were: 1. LUCIUS QUINCTIUS FLAMININUS (?-170 B.C.). Admiral and general, brother of the more renowned Titus Quinctius Flamininus described below. He was curule ædile in 200 B.C. and prætor in 199. In the war conducted by Titus Flamininus against Philip, King of Macedonia, in 198, Lucius commanded the Roman fleet, with which he sailed around Greece and, joined by the fleets of Attalus, King of Pergamus, and the Rhodians, laid siege to the city of Eretria in Eubœa, which was defended by a Macedonian garrison. He soon gained possession of all Eubœa and then returned to the west coast of Greece and laid siege to Cenchree, the harbor

of Corinth; but Corinth itself he was unable to capture. (See MUMMIUS.) In 192 Flamininus was consul with L. Domitius Ahenobarbus. At the end of his year he set out for Gaul as proconsul, ravaging the country of the hostile Ligurians and Boii on his way and inflicting crushing defeats. His moral conduct at this period disgraced both the man and the high office he held; and several years later, in 184 B.C., the censor, M. Porcius Cato, arraigned him before the Senate in a most bitter speech and expelled him from that body. He died in 170 B.C. 2. TITUS QUINCTIUS FLAMININUS (c. 230-175 B.C.). Brother of the preceding. He was a statesman and general, and the hero of the wars against Philip and Antiochus. He was quaestor in 199 B.C., and consul in 198, without holding the intermediate offices of *ædile* and *prætor*. He obtained Macedonia as his field of operations and set sail from Italy for Greece with a small army of veteran troops. He made Epirus his base and waited patiently for an opportunity of crossing the mountains and invading Macedonia. When at length, through the help of a friendly Epirote, the opportunity came, he entered Macedonia and attacked Philip's army in the rear, massacring 2000 men and driving the rest in the direction of Thessaly. Thessaly next was overrun, and then, making a long detour to the south, he took the towns of Phocis. At the same time his brother Lucius (see above), in command of the fleet, had induced the Achæan League to take sides with the Romans. Thus the year of Flamininus' consulship had brought great advantages to the Roman cause and weakened greatly Philip's prestige in Greece. Flamininus was thus enabled to demand, as a price of truce, that the Macedonian garrisons be withdrawn from the whole of Greece. This price Philip was unwilling to pay. A double commission, accordingly, was sent to Rome, with envoys from Philip and from Flamininus; but the Senate decided to prolong the latter's *imperium* and gave notice to the former that the Roman general had full authority to prosecute the war to the end. Thus began the second year of the struggle (197 B.C.), which very soon decided the fate of the Macedonian King. The opposing armies met at Cynocephalæ, and the rout of Philip's army was complete. Yet Flamininus would not accede to the demands of his allies that Philip should be dethroned and his kingdom broken up. He contented himself with depriving him of all his possessions in Greece and Asia and left Macedonia intact. Soon after this he won the enthusiastic applause of the Greeks by declaring, at the Isthmian Games, in the presence of delegates from all of the Greek states, the freedom and independence of all the towns that had been under Macedonian rule. The complete independence of the Greeks was menaced by Nabis, Tyrant of Sparta, who had been allied with the Romans against Philip; Flamininus therefore brought force to bear upon Nabis and compelled him to desist from offensive tyranny. In short, when he took his departure from Greece in the spring of 194 B.C., there was no better loved man in all the country than Flamininus "The Liberator." In 192 a new trouble broke out in the East, and Flamininus returned to Greece. Antiochus, King of Syria, and Nabis, Tyrant of Sparta, were allied against the Romans, but this difficulty was again smoothed over by the tact of the Roman general. When he again returned to Rome, he was made

censor, in 191 B.C. We last hear of him as Ambassador to Prusias, King of Bithynia, in 183 B.C., when the aged Hannibal (q.v.) was driven to commit suicide for fear of being delivered to the Romans. In 174 B.C. funeral games in honor of Flamininus were celebrated by his son; from this it has been supposed that he died early in this or late in the preceding year. Flamininus was a man of great ability, of consummate tact and a skillful diplomat, warmly devoted to Greek culture, and an ardent supporter of a policy for Rome of Imperialistic Expansion. An instance of his self-control is the story that, when the Achæans sought to honor him before his return to Rome, he asked only that they should redeem the Italians who had been sold into slavery in Greece during the war with Hannibal; 1200 such Italians he brought back with him to Rome. His life was written by Plutarch. On both the Flaminini, consult Niese, *Geschichte der griechischen und makedonischen Staaten seit der Schlacht bei Chæronea*, vol. ii (Gotha, 1893-1903).

FLAMINIO, flä-mě'ně-ô, MARCANTONIO (1498-1550). An Italian poet, son of Giannantonio Zarabbinì di Cotignola, professor at Serravalle (1516-36), who took the name Flaminio. In 1545 he refused the post of Latin secretary at the Council of Trent, where he appeared as a member of the conservative reform group, having been previously associated with Valdès, Reginald Pole, and other radicals. His complete works, with his father's poems, were published at Padua (1743); they include some lyrics, which are, if anything, superior to the average of Petrarchistic production, a poetical version of 30 psalms, prose versions of all the psalms and of the twelfth book of Aristotle's *Metaphysics*, and an Italian grammar, *Compendio della volgare grammatica*. Consult Cuccoli, *Marcantonio Flaminio* (Bologna, 1897).

FLAMINIUS, GAIUS (?-217 B.C.). A Roman general, renowned in the Gallic and Hannibalic wars and as builder of the Via Flaminia and of the Circus Flaminius at Rome. Descended from high plebeian stock, he was the most illustrious member of his family. We first hear of him as tribune of the people (*tribunus plebis*), in 232 B.C., when his energies were wholly employed in opposition to the Senatorial, or Conservative party. He proposed and carried an agrarian law for the division among the plebeians of the lands of Picenum and of the Senonian Gauls. (See AGRARIAN LAWS.) This tract, of great extent, south of Ariminum, had lately been won by force of arms. As *prætor* in 227, he received the government of the Province of Sicily, which he administered well. In 223 he was consul with P. Furius Philus and took the field against the Gauls of northern Italy, who, frightened at the above-mentioned division of Gallic lands and fearing similar attempts on their own territories, had broken into hostilities against Rome. As soon as Flaminius with his army left the city, his political enemies set about to secure the annulment of his election on religious grounds. Just as the consuls were preparing battle with the Insubrian Gauls a dispatch arrived from Rome with orders to return at once; but it was not opened until Flaminius had gained a signal victory on the banks of the Adda. Upon learning the purport of the dispatch Furius at once left the field; but Flaminius refused to obey until he brought the campaign to a successful ending. He was sum-

moned before the Senate to answer for his disobedience, but the admiring populace accorded him a triumph. In 221 he was *magister equitum* to the dictator, M. Minucius Rufus; but, owing to an unfavorable omen, both were soon forced to abdicate. In 220 he was censor with L. Æmilius Papus and constructed the great highway from Rome to Ariminum, on the Adriatic Sea, called after him Flaminia Via. In 218 he gained the further enmity of the Conservatives by supporting a proposal of Q. Claudius that senators and senators' sons should not possess seagoing vessels except for the transportation of the produce of their own estates. Elected consul again for the year 217, he took command of the army to check the advance of Hannibal, and in his haste to leave the city he neglected to observe the customary religious formalities. In order to block Hannibal's march he led his troops from Ariminum (Rimini) to Arretium (Arezzo), but was caught unprepared on the shores of Lake Trasimene and was killed in a three hours' battle, in which 15,000 of his troops perished. The extant accounts of Flaminius (consult especially Livy, xxi-xxii, Polybius, ii-iii) are prejudiced; they go back to patrician sources. Consult "Flaminus" in Lübker, *Reallexikon* (8th ed., Leipzig, 1914).

FLAMM, flām, ALBERT (1823-1906). A German landscape painter, born at Cologne. He was a pupil of Andreas Achenbach at Düsseldorf, where he settled after traveling in Italy. His pictures, the subjects of which are chosen almost exclusively from Italian scenery, command attention by their truthfulness to nature, careful execution, and bright and varied effects of color. One of his best productions is the "Approaching Storm in the Campagna" (1862). Among others may be mentioned "Via Appia," in the Kunsthalle at Hamburg, a fine "Italian Landscape" (1856), in the Ravené Gallery, Berlin, and "View of Cumæ" (1881), in the National Gallery in Berlin. In 1900 the title of professor was conferred upon him.

FLAMMARION, flā'mā'rē'ōn', CAMILLE (1842-). A French astronomer, born at Montigny-le-Roi, Haute-Marne. He is best known as a writer of popular scientific books, among which may be mentioned: *La pluralité des mondes habités* (1862; 34th ed., 1890); *Les merveilles célestes* (1866); *L'Atmosphère* (1872; new ed., 1887); *Le monde avant la création de l'homme* (1884); *Uranie* (1889); *La planète Mars et ses conditions d'habitabilité* (1892); *La fin du monde* (1894); and several astronomical and spiritistic romances, and essays, of which *L'inconnu et les problèmes psychiques*, translated into English under the title *The Unknown and Psychic Problems* (1904), is typical. His combination of mysticism and science results from early theological studies at Langres and Paris. He wrote also *Astronomy for Amateurs* (1904); *Thunder and Lightning* (1906); *Mysterious Psychic Forces* (1907); He became editor of a popular scientific magazine, *Cosmos*, in 1863 and in 1865 scientific editor of a newspaper, *Le Siècle*. There is a *Life*, by S. Hugo (Paris, 1891). He became editor of *L'Astronomie*, a monthly review which he founded in 1882, and of *L'Annuaire astronomique et météorologique*. In 1887 he founded the Astronomical Society of France and was elected its first president. Among his more solid contributions to astronomical science may

be mentioned his work on double and multiple stars, the topography and physical constitution of Mars and the moon, and the proper motions of the stars.

FLAMMBURG, flām'būrk, GOTTFRIED. See ERRARD, JOHANNES HEINRICH AUGUST.

FLAMMERMONT, flā'mār'mōn', JULES GUSTAVE (1852-99). A French educator and historian, born at Clermont (Oise). In 1886 he became professor of history and of the geography of antiquity and of the Middle Ages in the faculty of letters at Poitiers, and subsequently was called to a similar chair at Lille. His publications include: *Le chancelier Maupeou et les parlements* (1884; crowned by the Academy); *Études critiques sur les sources de l'histoire au XVIII^e siècle* (1886); *Lille et le Nord au moyen âge* (1888); *Mémoires sur les grèves et les coalitions ouvrières à la fin de l'ancien régime* (1895); *Album paléographique du nord de la France* (1897).

FLAMMOCK'S REBELLION. An outbreak which occurred early in June, 1497, in Cornwall, England, in opposition to the levying of a tax to defray the expenses of the war against Scotland. It was led by one Thomas Flammock and took the form of a march against London. The insurgents were defeated on Blackheath on the seventeenth of the month, and the leaders were summarily executed.

FLAMSTEED, JOHN (1646-1719). The first astronomer royal of England, born at Denby, near Derby. While yet a youth, he mastered the theory of the calculation of eclipses. His calculations were the means of introducing him to the notice of the eminent scientific men of his time, such as Halley and Newton, through whom he was appointed astronomer to King Charles II in 1675. The year following the observatory at Greenwich was built for his use, and he began that series of observations that marked the commencement of modern practical astronomy. He formed a catalogue of the fixed stars and furnished the lunar observations on which Newton depended for the verification of his lunar theory. His last years were embittered by disputes with Newton and Halley concerning the publication of his observations. His great work, *Historia Cœlestis Britannica*, in 3 vols., giving an account of the methods and results of astronomical observation up to his time, was not published till 1725. Consult Baily, *Account of the Rev. John Flamsteed* (London, 1835).

FLANAGAN, JOHN (1865-). An American sculptor, born at Newark, N. J. He studied in Boston under Bartlett, in New York under Saint-Gaudens, and in Paris under Chapu and Falguière. He succeeded especially well in relief work, for which he received silver medals at the Paris Exposition of 1900, at Buffalo in 1901, and at St. Louis in 1904. His principal works include an elaborate clock in the Congressional Library, Washington; a bronze relief in the Newark Public Library; the "Birth of Aphrodite" in the Knickerbocker Hotel, New York; four panels in the Chicago City Hall; and three reliefs for the interior of the Scroll and Key Society building, Yale University. He is also represented in the Metropolitan Museum, New York, and the Luxembourg Museum, Paris.

FLANAGAN, RODEBICK (1828-61). An Australian journalist, born in Ireland, but taken by his parents to Sydney at the age of 12. He learned his trade in a printing office; was a reporter for the daily papers; and started

with his brother a short-lived weekly, the *Chronicle*, which later became the *Empire*, and of which latter paper he became editor in chief. The *Empire* was notable for its advocacy of better treatment of the Australian aborigines. By 1854 he was on the staff of the *Sydney Morning Herald*, but labored so hard at his *History of New South Wales* that he died from overwork while in London preparing it for publication. The book was issued (1862) after his death.

FLANCH'ES, or **FLANQUES**, flänk. See HERALDRY.

FLAN'DERS (Flem. *Vlaenderen*, anciently *Vlaeland*, submerged land). The old name of an extensive region embracing, besides the present Belgian provinces of East and West Flanders, the southern portion of the Province of Zealand, in Holland, and the French Department of Le Nord, and constituting in the Middle Ages a powerful and almost independent principality, ruled by counts under the suzerainty of the French King. Under the Franks the river Scheldt, which flowed through the district, formed the boundary line between Neustria and Austrasia, in consequence of which the northern and southwestern parts of the territory comprised under the term "Flanders," although its population was decidedly Germanic, came to belong to France, while the southeast, although to a large extent non-Germanic, was after 1007 included in the Holy Roman Empire. Flanders obtained its name from the *Vländergau* (*pagus Flendrensis*), the district around Bruges and Sluis, whose counts had been made wardens of the northern coasts of France at the period of the incursions of the Northmen, in the latter half of the ninth century, and who extended the name of their hereditary possessions to the whole district which they governed. The first Count, or Margrave, of the country is said to have been Baldwin, surnamed Bras de Fer (Iron-Arm), who married Judith, the daughter of Charles the Bald of France and widow of Ethelwulf, King of England, and received the newly created "mark," or county, as a hereditary fief from his father-in-law in 864. Baldwin died about 878. He is said to have inaugurated the industrial greatness of Flanders by introducing into the country great numbers of workmen skilled in the manufacture of woolen and other goods. Baldwin IV with the Beard, one of the successors of Baldwin Bras de Fer, received in fee from the Emperor Henry II the burgraviate of Ghent, Walcheren, and the island of Zealand, and thus became a prince of the Empire. He was succeeded by his son, Baldwin V, or the Pious (1036-67), who increased his possessions by the addition of the German territory between the Scheldt and the Dender, belonging to the Duchy of Lower Lorraine. To this he added Tournai, the supremacy over the bishopric of Cambrai (to which, till the erection of the new bishopric of Arras, the County of Flanders had been ecclesiastically subordinate), and the County of Hainaut. During the Middle Ages Flanders figured prominently in the political affairs of Europe—the counts of Flanders being more powerful and wealthy than many European kings. Baldwin IX, the founder of the Latin Empire at Constantinople (see BALDWIN I), died in 1206, leaving two daughters, one of whom died without children; the other bequeathed Hainaut to John of Avesnes, her son by her first marriage, and Flanders to Guy of

Dampierre, her son by a second marriage. Meanwhile the industrial prosperity of Bruges, Ghent, and other cities of Flanders had become so great that the citizens began to feel their own power and to claim independence. They formed republican communities like the free cities of Germany, with this difference, that they admitted the nominal suzerainty of the counts. But they were not afraid to take up arms in defense of their liberties against their nominal masters. Their resistance to arbitrary power took the form of opposition both to the counts of Flanders as their immediate lords (see ARTEVELDE, JACOB VAN), and sometimes, in conjunction with their counts, to the encroachment of the French King. In 1214 Philip Augustus of France gained a decisive victory at Bouvines (q.v.) over the united forces of John of England, the Count of Flanders, and Otto IV of Germany. In 1302 a force of 20,000 pikemen under Guy of Dampierre inflicted a crushing defeat at Courtrai on an army of 50,000 French knights, archers, and foot soldiers. It was largely at the instigation of the Flemings that Edward III of England assumed the title of King of France and invaded that country, marking the beginning of the Hundred Years' War (q.v.). Through the marriage of Margaret, the daughter and heiress of Louis II, Count of Flanders, to Philip the Bold of Burgundy in 1369, the country was united to the Burgundian's territories (1384) and afterward shared the fortunes of that duchy. The dukes of Burgundy brought a greater part of the former Duchy of Lower Lorraine under their domain and thus laid the foundation for the subsequent union of the States of the Netherlands, in which Flanders continued to form an important part. Under this dynasty Flanders prospered, and the arts were greatly encouraged. On the death of Charles the Bold the Netherlands, which constituted the most flourishing and opulent realm in Europe, passed in 1477 to the house of Hapsburg, by the marriage of his daughter Mary to the Archduke Maximilian. After the Netherlands had passed with King Philip II to the Spanish line of the house of Hapsburg, the territory of Flanders was considerably diminished; the portion called Dutch Flanders was transferred to the States-General by the Peace of Westphalia, and in the time of Louis XIV France seized upon other portions of Flanders and was confirmed in her possession by the treaties of Aix-la-Chapelle (1668), Nimwegen (1678), and Utrecht (1713). By the last, and by the treaty of peace concluded at Rastadt (1714), what remained of the Spanish Netherlands again fell into the hands of the house of Austria. In 1795 Flanders, like the other provinces of Belgium, was incorporated with the French Republic and afterward formed part of the Empire, as the departments of Lys and Escout (Scheldt). The Congress of Vienna united Belgium with Holland to form the Kingdom of the Netherlands. In 1830-32 Belgium liberated itself from Holland. Consult Le Glay, *Histoire des comtes de Flandre jusqu'à l'avènement de la maison de Bourgogne* (Brussels, 1853), and Kervyn de Lettenhove, *Histoire de Flandre* (4 vols., 5th ed., Bruges, 1898). See FLEMISH LANGUAGE AND LITERATURE.

FLANDERS, EAST. A province in the northwest of Belgium, the eastern part of the former County of Flanders (q.v.) (Map: Netherlands, B 4). Area, 1172 square miles. The surface is low and level and watered mainly by the

Scheldt and by its affluents, the Lys and the Dender. Part of the province in Waes is below sea level and has been reclaimed. The soil has been rendered extremely fertile by careful and systematic cultivation. Grain, potatoes, flax, hemp, and hops are produced in great quantities. The district in the northeast of the province, between the towns of Antwerp and Ghent, is celebrated as a flax-growing section. The province is one of the principal centres of the linen-weaving and flax-spinning industries and has also numerous tanneries, besides paper, woolen, and lace mills. The chief exports are lace, linen, and agricultural and animal products. Pop., 1900, 1,029,971; 1913, 1,134,079. Chief towns, Ghent (the capital), Aalst, and Dendermonde.

FLANDERS, HENRY (1826-1911). An American lawyer and writer, born in Plainfield, Sullivan Co., N. H. He was educated at Kimball Academy and at the Newbury (Vt.) Seminary, studied law, and after 1850 practiced at Philadelphia. He is best known as the author of *Lives and Times of the Chief Justices of the Supreme Court* (2 vols., 1855-58; last ed., 1881), which contains excellent biographical sketches of Jay, Rutledge, Cushing, Ellsworth, and Marshall, and has long been a standard work. Among his other publications are: *A Treatise on Maritime Law* (1852); *A Treatise on the Law of Shipping* (1853); *An Exposition of the Constitution of the United States* (1860); *A Treatise on the Principles of Insurance* (1871); *Memoirs of Richard Cumberland* (1856); *Life of John Marshall* (1905).

FLANDERS, MOLL. A profligate woman, the subject of De Foe's *Fortunes of Moll Flanders*.

FLANDERS, WEST. The westernmost province of Belgium, bordered on the northwest by the North Sea (Map: Belgium, A 4). It has an area of 1249 square miles. In general its surface is flat, low, and in parts marshy. There are sandy hills in the south and dunes along the coast. The Yzer and the Lys are the principal rivers. Numerous canals traverse the province. Agriculture, and particularly stock raising, flourish remarkably under a system of intensive agriculture. The manufactures are chiefly linens and laces. Nearly 40 per cent of the population are engaged in manufacturing. The capital is Bruges. Other important towns are Courtrai, Roulers, Ypres, and Ostend. Pop., 1900, 805,236; 1913, 884,777.

FLANDIN, flän'dän', CHARLES (1803-91). A French chemist, born at Aubues. In 1829 he was interne in Paris and three years afterward published his remarkable work on cholera. From that time he was best known as a toxicologist. His most important works are *De l'arsenic* (1841) and *Traité des poisons* (1846-53). His discoveries in regard to the action of sulphuric acid in carbonizing organic substances led him into a long and bitter polemic with Orfila.

FLANDIN, EUGÈNE NAPOLEON (1809-76). A French painter and archaeologist. He was born in Naples and studied in Paris under Horace Vernet. After painting several fairly successful pictures he served in the Algerian campaign and was afterward sent on an archaeological mission to Persia, with the architect Pascal Coste, and stayed in that country from 1839 to 1841. The valuable discoveries made there he published in a *Voyage en Perse* (1843-54; 6 vols., 665 plates). He also designed the plates for Botta's work on Nineveh and Khorsabad,

and himself published *Le monument de Ninive* (5 vols., 400 plates, 1847-50); *L'Orient* (1853-74); *Histoire des chevaliers de Rhodes* (1864-73). He is known chiefly for his valuable discoveries in history and archaeology. Among his paintings are: "Entrance of the French Army into Algiers" (Versailles Museum); "View of Bagdad" (Marseilles); "View of Athens" (Rouen).

FLANDRIN, flän'drän', HIPPOLYTE (JEAN) (1809-64). A French painter, one of the greatest religious decorators of the nineteenth century. He was born at Lyons, the second son of a miniature painter, and was taught by his father and in the art schools of Lyons. In 1829 he went to Paris on foot, with his brother Paul, and entered the atelier of Ingres and the Ecole des Beaux-Arts. During all their student days the brothers lived in distress and poverty. In 1832 Hippolyte won the Grand Prix de Rome, and thereupon studied five years in the Eternal City. Some of the pictures painted at this time are among Flandrin's most interesting compositions. The picture of "Dante and Vergil" (Lyons Museum) won a medal in the Salon of 1836, and "St. Clara Healing the Blind" (cathedral of Nantes), a gold medal in 1837. Soon after he settled in Rome Flandrin devoted himself definitely to religious painting. In 1839 he returned to Paris. In 1840 he received a commission for the decoration of the chapel of St. John in the church of Saint-Severin in Paris. The success of this work brought the very important commission for the decoration of the famous old church of Saint-Germain-des-Prés in Paris, which had been recently restored. He painted two of his best compositions, the "Entrance into Jerusalem" and the "Procession to Calvary," on the walls of the church. In 1846 he was further commissioned to paint the choir of this church. Flandrin decorated also the new church of St. Paul in Nîmes (1848-49) and the three apses of the church of the abbey of Ainay in Lyons.

In 1849 he received the commission for his most important work, the decoration of the great church of St. Vincent de Paul, built by the architect Hittorff in Paris. The work was at first offered to Ingres and afterward to Paul Delaroche. Refused by both, the commission was finally given to Flandrin and executed by him in 1850-54. The long frieze between the two superimposed arches, representing a procession of saints, is his chief work and one of the finest things in modern figure decoration. Induced by failing health to revisit Italy, he died of smallpox at Rome, March 1, 1864. At the time of his death Flandrin had projected decorations for the cathedral of Strassburg, and for the church of Saint-Augustin in Paris. Flandrin is the greatest religious painter of modern France, depicting the ideal conceptions of a primitive faith with the power of a finished art. Austere and cold in color, his paintings are excellent in draftsmanship and firm in execution. The effect of detail is always sacrificed to the majesty of the whole. He also painted numerous portraits of the notable men and women of his day, including Napoleon III (Versailles Museum), Prince Jerome Napoleon, Duchâtel, Madame Vinet (Louvre), and Mademoiselle Maison, known as "La jeune fille à l'œillet." He is, however, too reserved and lacking in animation to be a great portraitist. He was made officer of the Legion of Honor and member

of the Academy in 1853 and professor of painting in the Academy. His correspondence was published after his death by Delaborde, under the title *Lettres et pensées d'Hippolyte Flandrin* (Paris, 1865).

AUGUST (1804-42), the elder brother of Hippolyte, studied at the Ecole des Beaux-Arts in Lyons and became a lithographer. In 1832 he joined his brothers in the atelier of Ingres in Paris and visited Italy. Returning to Lyons, he opened a studio where he taught the doctrines of Ingres with much success.

JEAN PAUL (1811-1902), the younger brother of Hippolyte, studied at the Ecole des Beaux-Arts in Lyons, accompanied his brother to Paris, studied with Ingres, and went to Rome in 1834. He exhibited at the Salon frequently and won several medals, but spent most of his life as the assistant of his brother Hippolyte. After the latter's death he finished the decorations of the nave of the church of Saint-Germain-des-Prés from his designs. He was employed independently in the church of Saint-Séverin and the Palais de la Chancellerie. Paul persisted all his life in the classical tradition. He painted many landscapes, which are sincere and often full of charm. One of the best, "Solitude," is in the Luxembourg.

Consult: Saglio, in *Gazette des Beaux-Arts* (Paris, 1864); Arlich, in *Fine Arts Quarterly Review*, vol. v (London, 1866); Poncet, *Hippolyte Flandrin* (Paris, 1864); Clément, *Etudes sur les beaux-arts en France* (ib., 1865); Blanc, *Les artistes de mon temps* (ib., 1876); Lear, *A Christian Painter of the Nineteenth Century* (London, 1875); Beulé, *Notice historique sur la vie et les ouvrages de M. H. Flandrin* (Paris, 1869); Flandrin, *Hippolyte Flandrin: Sa vie et son œuvre* (ib., 1902).

FLANGE (later form of *flanch*, from *flank*, OF., Fr. *flanc*, ML. *flancus*, flank, from OHG. *hlanca*, flank, dialectic Eng. *lank*, groin). A projecting rim, rib, or ridge, on any object, as the ridge on the inner edge of a car wheel or the rim on the end of a cast-iron pipe. A railway rail is made up of a head, a web, and a base, and the base may be considered as formed by two flanges; a steel I-beam has a vertical web and a horizontal top and bottom double flange. Flanges are employed on a multitude of objects, of which those named are merely familiar examples. Joints in piping of the larger sizes are usually made by bolting together the opposing faces of two flanges, with a compressible flat disk of some softer metal or manufactured substance to make the joint tight against leakage of the fluid which the pipe is conveying. These flanges may be disks into which the end of the pipe is secured by screwing or expanding the metal; or in work of the highest class the flange is formed upon the end of the pipe without a joint. The bolts must draw the faces of the flanges together both so as to make the joint tight and also to resist the end thrust of any pressure within the pipe. See the article RAILWAYS.

FLANK (OF., Fr. *flanc*, flank). In military formations, a wing or extremity. Flank files, companies, battalions, or regiments are the troops on the right and left extremities of the main body. The flank is a source of weakness to the front in proportion to its length and vulnerability; and of strength if protected by the natural conformation of the terrain, in that it releases a larger force for the front, or wherever

the danger threatens. A *flanking* or *enveloping attack*, owing to the danger and cost of frontal attack, is now a movement of supreme importance. It consists in massing superior forces against the enemy's flank, meanwhile occupying his attention in front. A *turning movement* is usually understood to mean a wider flank march of a large body of troops having in view an attack against the enemy's flank. See ATTACK; TACTICS, MILITARY.

FLAN'NEL (OF. *flanelle*, of doubtful origin, possibly connected with OF. *flaine*, pillow case, which seems to be derived from the Celtic; Ir. *olann*, wool, Welsh *gwlân*, Corn. *gluan*, Bret. *gloan*, linen, Lat. *lana*, Eng. *wool*; with Fr. *fl* for Celt. *vl*, as in Fr. *flèche*, arrow, from Ir. *flesc*). A woven fabric used chiefly for underclothing and other garments. Flannels are usually made of wool, with which may be combined or woven silk, linen, cotton, or worsted yarns. They are dyed in all shades of solid colors, and many are printed or embroidered with various designs and patterns. Vegetable or chemical coloring agents are largely used for dyeing. All-wool flannels, which were used years ago by working people, have not been manufactured recently so extensively, owing to the cheaper and more attractive fabrics produced by the admixture or use of cotton, although all-wool blue flannels are still used largely by firemen, miners, sailors, and laborers. Flannels have suffered through the increased use of knitted garments, such as the so-called "sweater," and various forms of knitted articles of apparel for underwear which are used to their exclusion. French flannels are made of wool and worsted, or wool with silk warps in various grades, and are extensively used for women's garments. Canton flannels, so called, although made entirely of cotton, have the face of the goods carefully napped or teased. The fibres are fulled or felted and combed out so as to make a soft and fleecy surface. Outing flannels are loosely woven fabrics of cotton which have been manufactured within the past 30 years and have a napped face and are made in many designs with attractive colorings. Domett flannels are made with cotton warp and woolen filling, being manufactured in both plain and fancy colorings, in many instances the yarns being dyed before weaving.

For detailed description of manufacture of flannels and other fabrics, see WOOL AND WORSTED MANUFACTURES.

FLAN'NELMOUTH. A local name in the United States for (1) the great fork-tailed catfish (*Amiurus lacustris*) of the Mississippi valley; and (2) a sucker (*Catostomus latipinnis*) of the Rio Colorado and its tributaries.

FLASSAN, flâ'sân', JEAN-BAPTISTE GAËTAN RAXIS DE (1760-1845). A French diplomat and historian, born at Bedouin (Vaucluse) and educated in Paris. He became professor of history at the military Academy at Saint-Germain in 1812, was historiographer of the Ministry of Foreign Affairs until 1829, and was present at the Congress of Vienna, of which he wrote a history (2 vols., 1829). His principal work is the *Histoire générale de la diplomatie française depuis la fondation de la monarchie jusqu'au 10 Août 1792* (7 vols., 1811), and he wrote on contemporary diplomatic history.

FLAT (Icel. *flatr*, OHG. *flatz*, flat). A musical character, shaped thus, ♭, which, when placed before a note, lowers that note half a tone. If this note, or its octave, occurs more

than once within the same bar, it is always played flat, although not again marked. When the original natural tone is to be played again in the following bar, it is customary to mark it with a natural (\sharp). The *double flat* (bb) lowers a note two chromatic half tones.

FLAT. A suite of rooms on one floor containing all the requirements of a dwelling, in a building of several stories; an apartment in an apartment house. A "single" flat is one in a house having but one such suite to a floor; a "double" flat, one of two suites to a floor. This system has long been in use in Europe and particularly on the Continent, but recently has been more commonly adopted in England and America. In some American cities, especially New York, local usage distinguishes a "flat" as an apartment of the cheaper sort, in which there is no elevator or restaurant and usually no hall attendance. See **APARTMENT HOUSE**.

FLATEYJARBOK, flát/-yár-bök (Icel., book of Flatey). A collection of sagas connected with the times of the Norwegian kings Olaf Tryggvason and Olaf the Saint, once owned in the Icelandic island of Flatey, now in the Royal Library in Copenhagen. It is the work of two Icelandic priests (1380-95) and is one of the chief sources for the Norse discovery of America.

FLATFISH. A general name for a large and important group of marine acanthopterygious fishes constituting the suborder Heterosomata, and embracing the families Pleuronectidæ (flounders) and Soleidæ (soles). They have much compressed bodies, swim upon their sides, near the bottom, and all have the fore part of the skull twisted so as to allow of two eye orbits on the same side, one vertical and one lateral. See **FLOUNDER**; **SOLE**; **TURBOT**; **ETC.**

FLATFOOT; **PES PLANUS**. A depression of the inner half of the plantar arch, while the sole is not everted, caused by excessive weight, bone defect, or weakened ligaments. Certain occupations which require prolonged standing are prone to result in flatfoot. Waiters and cooks are especially affected. The remedy consists in forcing the bones into place, strapping with adhesive plaster, and wearing specially constructed shoes. See **CLUBFOOT**.

FLATHE, flá'te, **HEINRICH THEODOR** (1827-1900). A German historian, born June 1, 1827, at Tanneberg in Saxony. He studied philology and history in the University of Leipzig and in 1866 became a professor in the Fürstenschule at Meissen. He retired from active life in 1895 and died March 26, 1900. Flathe was an indefatigable writer and editor, his special field being Saxon and modern history. He published numerous monographs in Weber's *Archiv für sächsische Geschichte*. He prepared for the Heeren and Ukert series a new edition of C. W. Büttiger's *Geschichte des Kurstaates und Königreichs Sachsen* (1867-73). His own writings include: a history of the Fürstenschule at Meissen (1879); *Katechismus der allgemeinen Weltgeschichte* (1884); *Das Zeitalter der Restauration und Revolution, 1815-51*, in the well-known Oncken series (1883); *Deutsche Reden, Denkmäler zur vaterländischen Geschichte des 19ten Jahrhunderts* (1893-94); and contributions, in three volumes, under the title *Die neueste Zeit* (1887-92), to the *Allgemeine Weltgeschichte*, by Flathe, Hertzberg, and others. This work, covering the period from 1789 to 1887, has appeared in an English translation in four volumes,

comprising vols. xvi-xix in the "History of All Nations Series" (Philadelphia, 1902).

FLATHEAD. A fish, the barramunda (q.v.).

FLATHEAD, or **SALISH**. An important Salishan tribe, and the one from which the stock takes its name, formerly holding the mountain region of northwestern Montana and centring about the lake and river of that name. Among the early explorers and traders they were noted for their friendly and honorable character, and because, while not aggressive, they bravely defended themselves against the inroads of their enemies, the Blackfeet. Singularly enough, they never had the custom of flattening the head, as their popular designation would imply, the name arising from the fact that the more western tribes on the Columbia, which practiced this custom almost universally, considered themselves in consequence as having *pointed* heads, and therefore distinguished the Salish, whose skulls were not thus deformed, as "flatheads." The Jesuit missionary De Smet began work among them in 1841, founding the mission of St. Mary, long known as the most successful Indian mission in the Northwest. Together with the confederated Pend d'Oreille and a band of Kutenai Indians they are now gathered upon the Jocko reservation within their ancient territory, the combined tribes numbering 1588. See **SALISHAN STOCK**.

FLATMAN, THOMAS (1637-88). An English poet and miniature painter, born in London. He was educated at Winchester and Oxford and was admitted to the bar, but gave up law to follow art and literature. His *Poems and Songs* (1674, 1686) were well received, but have been unfairly depreciated by later critics. His miniatures, which Vertue declared to be second only to Cooper's, are more valued at the present day, notably that of himself in the Dyce collection, South Kensington Museum, which is remarkable in execution and intensity of expression. The Wallace collection, London, possesses a portrait of Charles II by him. He was credited with the authorship of certain satirical works in prose, and he undoubtedly inspired Pope's *Dying Christian* by his own "A Thought of Death," one of the *Poems and Songs*.

FLAT RIVER. A community in St. Francis Co., Mo., 65 miles south of St. Louis, on the Illinois Southern and the Mississippi River and Bonne Terre railroads (Map: Missouri, F 4). Lead mining is the chief industry. It was discontinued in 1911. Pop., 1910, 5112.

FLATTERS, flá'tár, **PAUL FRANÇOIS XAVIER** (1832-81). A French officer and explorer, born at Laval, a son of Jean Jacques Flatters, the sculptor. He took part in the Crimean War and was made lieutenant at Sebastopol, distinguished himself in the Italian campaign (1859) and was captured at Sedan. After eight years of service in Algeria he was ordered by the government to act on a commission to consider building a railroad to the Sudan. His first expedition, which started in 1880, got as far as Lake Menkhugh and turned back just in time to escape the Tuaregs. The second trip began in the latter part of the same year and was probably watched all the way by Berber spies. Six hundred men from three Tuareg tribes met the party at Bir-el-Gharama, lured Flatters away and killed him, and later massacred all the party but 20. The official record of the expedition was lost, but some of Flatters's papers were preserved, and they are the basis of

5. TURBOT (*Rhombus maximus*).
6. PLAICE (*Pleuronectes platessa*).

the earlier knowledge of the Sahara. Consult Brosselard, *Les deux missions Flatters* (2d ed., Paris, 1889).

FLATTERY, CAPE. See CAPE FLATTERY.

FLATULENCE (from Neo-Lat. *flatulentus*, flatulent, from Lat. *flatus*, a blowing, from *flare*, to blow, OHG. *blājan*, Ger. *blāhen*, AS. *blāwan*, Eng. *blow*). Distension of the stomach or bowels by the gases formed during digestion. See INDIGESTION.

FLATWORM. A general name for a group of worms constituting the phylum Platyhelminthes (q.v.), and embracing the planarians, flukes, tapeworms, and nemerteans. The body in almost all cases is greatly flattened, so as to be leaflike or ribbon-like, with an anterior end marked in some way, though a head is rarely distinct, and right and left sides; some are minute, others easily visible, or like long narrow ribbons. Some are vividly colored, but most are of dull hue, and there is a varying complexity of structure and great diversity in habits of life. In development some are direct, while others go through a metamorphosis. They are the most widely distributed of any phylum, dwelling "on land, in fresh water down to the bottom of some of the deepest lakes, on the sea-shore, in deep sea, and on the surface of the ocean; and parasitic flatworms live, in one phase or another, in animals of nearly every class of the Metazoa." They are regarded as having been developed from some low ancestral type of coelenterates. Consult Parker and Haswell, *Text-Book of Zoology* (New York, 1910); Gamble, *Cambridge Natural History*, vol. ii (London, 1896); Benham, "Platyhelminia," in Lankester's *Treatise on Zoology*, vol. iv (London, 1901). See FLUKE; NEMERTINEA; PLANARIA; TAPEWORM.

FLAUBERT, flô'bâr', GUSTAVE (1821-80). A French novelist. The merit of his works lies not only in their faultless style, acquired by the sacrifice of five and six years on each separate production, but in the precision with which they enunciate a view of the art of fiction that was to dominate the succeeding generation. *Madame Bovary* (1857) gave "the formula of the modern novel" (Zola), the code of the naturalistic school. Flaubert was born in Rouen, the son of a surgeon, and inherited a power of psychic diagnosis and dissection. He was well to do, able to cultivate his taste by travel and to write at leisure. His early influences were strongly romantic, fostered by a violent love affair with a lady whom he has pictured as Madame Arneux in *L'Education sentimentale*, and by a tenderly Platonic attachment to Madame Colet. Hating democracy and its commonplace bourgeoisie, and wishing to hide the disease to which he was subject, which, if not epilepsy, resembled it in its symptoms, he became more and more a recluse. Except for literary journeys to the East, particularly to Carthage, he spent his life at a suburban house in Rouen, cloistered for months together in unremitting study, relieved by occasional visits to Paris, where he gave free scope to a Rabelaisian fancy in the society of the Goncourts, whose *Journal* is filled with his sayings. In general he affected, and in good measure attained, an objective attitude towards life, which, he says, appeared to him as material for description; and he is thus the type of the artist for art's sake. He carefully instilled this same spirit in his pupil and godson, Guy de Maupassant (q.v.). *Madame Bovary* (1857) is the epic of the commonplace, the bitterest satire on ro-

manticism. In it sentiment leads to shipwreck, self-sufficient mediocrity to success. *Salammbô* (1862) applies the same method and philosophy to the civilization of ancient Carthage; *L'Education sentimentale* (1869) to the Paris of 1848, seeking to be "implacable," and becoming unjust, but producing what Zola pronounces "the only truly historical novel that I know in which the resurrection of dead hours is absolute, with no trace of the novelist's trade." In *La tentation de Saint-Antoine* (1874) Flaubert pushed the paradox to its extreme and in 300 pages of the most polished prose of his century sought to express the essential folly and futility of thought itself and of the whole sentient world. *La tentation* is the supreme expression in fiction of nihilistic pessimism, of the idealist turned skeptic, and withal the best example of dream literature in the world. The *Trois contes* (1877) shows Flaubert's genius epitomized. There is pathos of sordid commonplace in *Un cœur simple*; a remarkable power of projection into other realms of thought and life is in *La légende de Julien l'hospitalier*, and in *Hérodias* there is a grandiosely romantic realism. These three tales would alone suffice to define Flaubert's place as the connecting link between the romantic and the naturalistic schools. Belonging to neither, he unites both in a synthesis of romanticism and science that was to guide the development of the French novel for a generation. The above-mentioned masterpieces have been translated into all important languages. His "complete" works were published in 1885 in eight volumes; they did not include his two unsuccessful plays, nor his four volumes of *Correspondance* (1873-85). Consult: Tarver, *Gustave Flaubert as Seen in his Works and Correspondence* (London, 1895); Faguet, *Flaubert* (Paris, 1899); Albalat, *Le travail du style* (ib., 1903); T. de Gautier, *La philosophie du bovarysme* (ib., 1911); L. Bertrand, *Gustave Flaubert* (ib., 1912).

FLAUGERGUES, flô'zhârg', HONORÉ (1755-1830). A French astronomer, born at Viviers, where he lived and died, never leaving the town. He refused an offer of the directorship of the observatory of Toulon in 1797, preferring, it is said, to be justice of the peace in Viviers. His contributions to various technical journals from 1790 to 1830 dealt with the satellites of Jupiter, Saturn's ring, the spots and markings on Mars, and especially with comets. He discovered the great comet of 1811.

FLAUX, flô, ARMAND DE (1819-). A French author, born at Uzès. He published *Nuits d'été* (1850), *Sonnets* (1864), and descriptive works on Tunis, Denmark, and Sweden, whither he had been sent upon literary missions by the government.

FLAV'EL, JOHN (c.1630-91). An English Presbyterian divine, born at Bromsgrove, Worcestershire, and educated at University College, Oxford. He became curate at Diptford in 1650 and at Dartmouth in 1656. Under the Act of Uniformity he was ejected from his living, but he continued to preach privately. After 1687 he was minister of a Nonconformist church at Dartmouth. Among his popular writings on practical religion is *Husbandry Spiritualized* (1669). His collected writings appeared in six volumes (London, 1820), and selections, ed. by Bradley (ib., 1823). Consult the memoir prefixed to the collected works.

FLA'VIAN (Lat. *Flavianus*), SAINT (c.329-

404), Patriarch of Antioch, 381-404. He led an ascetic life, devoted his property, which was considerable, to the church, became an influential member of the Meletian party in the contest with the Eustathians (see EUSTATHIUS; MELETIUS), and was chosen by the former to succeed Meletius as Patriarch in 381. The Eustathians strove for the recognition of Paulinus, who had already been set up in opposition to Meletius, and a bitter contest ensued. In 387 a serious sedition occurred in the streets of Antioch, and the statues of the Emperor Theodosius were overthrown. Flavian journeyed to Constantinople, and his influence was sufficient to prevent the punishment of the rebellious people. It was then that Chrysostom's famous *Orations on the Statues* were delivered. After 392 Flavian had no rival claimant for the patriarchate, although some of the Eustathians continued to oppose him till his death. None of his writings have survived. His day in the Greek Church is September 26.

FLAVIAN, SAINT (?-449). Patriarch of Constantinople, successor to Proclus in 446. He was the opponent of Eutyches (q.v.). He was deposed in 448 by the Council of Alexandria, and he is supposed to have died from injuries inflicted by Dioscorus, the president of the council, Aug. 11, 449, at Hypæpa, in Lydia. He is enrolled in the martyrology of the Latin church, his day being February 18.

FLAVIAN, SAINT (?-518). In early life a monk, he became Patriarch of Antioch in 498, was deposed in 512, and banished to Petra, in Arabia, where he died, July, 518. He wavered in his faith, yet died in the odor of orthodox sanctity, and was enrolled among the saints of the Greek church and also, after considerable opposition, among those of the Latin church. His day is July 4.

FLAVIAN EMPERORS. A term used to designate three Roman emperors, Vespasian and his two sons, Titus and Domitian.

FLAVIGNY, flâ'vê'nyê', MARIE CATHERINE SOPHIE DE. See AGOULT.

FLAVIN (from Lat., *flavus*, yellow). The most important coloring matter obtained from quercitron. As sometimes prepared, it consists mostly of quercitrin, $C_{21}H_{32}O_{12}$, $2H_2O_4$ (Herzig) or $C_{21}H_{32}O_{11}$, $2H_2O$ (Moore). It is then known as yellow flavin. Red flavin, on the other hand, contains only quercetin, $C_{15}H_{10}O_7$. The yellow flavin is probably prepared by extracting quercitron bark under high steam pressure; the red flavin is produced by extracting the bark with alkali and boiling the solution with sulphuric acid. The precipitate formed is washed free from acid and dried. Flavin gives bright yellow or orange shades in connection with alum or tin mordants; with iron mordants, gray, olive green, and a peculiar shade of black; with chromium oxide, olive yellow.

FLAVIO, flâ'vyô, BIONDO, or FLAVIUS BIONDUS DA FORLÌ (1388-1463). An Italian historian, humanist and antiquary of Forlì. Ambassador of Forlì in Milan (1388), he lived as an exile in Venice (1423-32), serving as secretary for Barbaro and Barbarigo. He took a similar post with Pope Eugene IV in 1432 and lived in Rome for many of his remaining years. His *Decades*, fashioned after the manner of Livy, became the model for historical writing in their century, setting a new standard for methods of research and for impartial discussion. Biondo, though now entirely supplanted in his subject,

was one of the first to become conscious of the great change that occurred in Europe in the transition from Rome to the Middle Ages and to set about the analysis and explanation of it. Consult the *Works* (Basel, 1559), biography by Masius (Leipzig, 1879), and Sabbadini in *Giornale Ligustico* (Genoa, 1891).

FLAVORING PLANTS (from *flavor*, OF. *flavour*, odor, ML. *flavor*, yellow gold, yellowness, from Lat. *flavere*, to be yellow, from *flavus*, yellow). Plants which impart their characteristic flavors to condiments, culinary preparations, beverages, medicines, etc., with which they are mixed. Usually the part richest in the flavor is employed either in its native state or prepared in some way. The following examples will illustrate: the bark of the root (sassafras); the root (licorice); rhizome (ginger and peppermint); bark (cinnamon); leaves (bay and culinary herbs, such as sage, thyme, etc.); flower buds (cloves, capers); flowers (hops); aril of the seed (mace); rind of the fruit (citron, etc.); unripe fruit (allspice); fresh ripe fruit (lemon); dried ripe fruit (vanilla, pepper); seed (nutmeg, caraway). Many of these owe their powers to essential oils, which in some cases are extracted and used in a similar manner; flavors of others are due to esters, alkaloids, etc. Spices, a group of flavoring plants, are almost wholly tropical in their origin and were formerly grown in and exported from the East. Arabia was at one time noted as the land of spices, not so much because spices were produced there as because that country was the great distributing centre. Tropical America, which has made some notable additions to the list of flavoring plants, e.g., Cayenne pepper and vanilla, has developed a profitable industry in the growing and the exporting of certain Asian spices, especially ginger and cloves.

The five spices illustrated herewith are treated more fully under their respective names. 1. Cinnamon is the dried bark of *Cinnamomum zeylanicum* and of its close relatives, trees which grow in the East. The species figured is a native of Ceylon, which is cultivated in many other tropical countries, but nowhere else produces bark of such high quality. 2. Black pepper, the most widely used of all spices, is the dried fruit of *Piper nigrum*, a native of the East Indies, but cultivated in other tropical countries. The stems, which are vinelike and seldom grow more than 20 feet long, spread so much that poles or trees are used to support them. The plants produce a profusion of mostly hermaphrodite flowers in spikes opposite the leaves. The crop is gathered as soon as the first berries become red and is ready for export after drying. 3. Nutmeg is the kernel of the fruit of *Myristica fragrans* and other related species, trees indigenous to the East, but cultivated in the tropics throughout the world. The succulent golden-yellow pearlike fruit opens by two valves and exposes the kernel as shown. These exterior parts, which look like candied fruit, are often preserved as a confection. The inner envelop which surrounds the nut is used in cookery under the name of mace (q.v.). 4. Ginger, the creeping rootstocks of various species of *Zingiber*, of which the commonest is *Zingiber officinale*, is used as a condiment and a medicine, for which purposes it is cultivated in and exported from various tropical countries, especially the West Indies. The finest quality is said to come from Jamaica. The common species is

1 CINNAMON - CINNAMOMUM ZEYLANICUM

2 BLACK PEPPER - PIPER NIGRUM (A, FRUIT)

3 NUTMEG - MYRISTICA FRAGRANS (A AND B FRUIT)

4 GINGER - ZINGIBER OFFICINALE

5 CLOVES - EUGENIA CARYOPHYLLATA (A, FLOWER BUD)

a native of the East Indies, where it has been cultivated for hundreds of years. 5. Cloves are the dried flower buds of the clove tree (*Eugenia caryophyllata*), a pyramidal evergreen often 40 feet tall in its native home, the Spice Islands. The leaves, flowers, and bark are aromatic, and the olive-like fruit, which is exported to a small extent under the curious name of "mother of cloves," has a similar but weaker odor and flavor. See HERBS, CULINARY.

FLAX (AS. *flax*, OHG. *flahs*, Ger. *Flachs*; probably connected with Goth. *flakta*, hair plait, Ger. *flechten*, to weave, Lat. *plicare*, to fold). An annual plant of the genus *Linum* (family Linaceæ), of which there are more than 100

FLAX.

known species, mostly annual and perennial herbs, scattered over the globe. They are most abundant in Europe and northern Africa. The common flax (*Linum usitatissimum*) is an annual indigenous to the Mediterranean region of Europe and Africa and to some parts of Asia, but now distributed over both hemispheres. This most common species of flax has a very slender, erect stem, 2 to 3 feet tall, branching only near the top, which bears beautiful blue, or sometimes white, flowers. The seeds are dark brown, glossy, flattened, with acute edges.

No plant not yielding food to man is more useful than the flax plant. It is highly valuable both for the fibres of its inner bark and for its seeds. Flax fibres are characterized by length, fineness, solidity, and suppleness. Their length is invaluable in spinning, and the nature of their surfaces prevents them from slipping on each other, thus contributing to the durability of fabrics made with them. When separated from both the bark and the inner woody portion of the stem, they constitute the well-known material from which linen thread and cloth are made, and they are used for manufacturing the finest and the coarsest fabrics, the most delicate and exquisite lace, linens, shirtings, and handkerchiefs, twines for shoemakers and harness makers, cords for the warp of carpet and the body of oilcloth, sailcloth, rope, and cordage.

The seeds yield by expression the drying fixed oil called linseed oil (q.v.), used for mixing paints, varnishes, etc. The remaining crushed mass is linseed cake, or oilcake, esteemed for feeding cattle, and which, when finely ground, becomes linseed meal. Linseed is sometimes used in medicine as an emollient and demulcent in irritations of the mucous membranes generally, but especially of the pulmonary and urinary organs. The world's annual flax-fibre production is about 1,500,000,000 pounds, of which over 1,000,000,000 pounds is furnished by Russia alone. In no European country is flax more successfully cultivated than in Belgium, where it is employed in the manufacture of Brussels lace, the crop when prepared for market sometimes exceeding in value the land on which it was produced. The excellence of Belgian flax must be ascribed largely to the care bestowed on its cultivation and the superior retting facilities offered along the river Lys.

History. Flax has been cultivated from the earliest historic times. It is mentioned in the Book of Exodus as one of the products of Egypt in the time of the Pharaohs, and microscopic examination has shown that the mummies of Egypt are enveloped in linen cloth. As in the days of Solomon, who purchased linen yarn in Egypt, and as in the time of Herodotus, who wrote of the great Egyptian flax trade, Egypt still grows large quantities of flax. In Europe its cultivation is very extensively carried on, especially in Russia, Austria-Hungary, Belgium, and Ireland. In America it has been cultivated since the period of earliest settlement. During the Civil War in the United States efforts were made in some quarters to substitute it for cotton, the supply of which was cut off. But since the two fibres demand essentially different treatment, and since the machinery employed in the manufacture of cotton fabrics is not adapted to the manufacture of linen fabrics, the experiments were not satisfactory. For its fibre the culture of flax is attracting increased attention in the United States, and it is being produced in small quantities for this purpose in Michigan, Wisconsin, Minnesota, Oregon, and Washington; for its oil it is largely grown in a number of States. From time immemorial flax has been cultivated in India for its seed, but not for its fibre. In that climate the plants seldom exceed 18 inches in height and are much branched, yielding a worthless fibre, but a large quantity of seed richer in oil than the European or the American seed.

Cultivation. Flax will grow in almost any part of the United States, but it needs a strong, rich soil and careful manipulation at every stage of its production and manufacture. The heavier soils, when well drained and of proper fertility, are preferable to sandy loams; wet soils are fatal to success. In general, a deep, moist, strong loam upon upland and free from weed seeds, which must be avoided above all things, will give best results. As far as possible weeds should be eliminated by previous cultivation. Flax is believed to make heavier demands upon the soil than does any other crop, and for this reason it is frequently called exhaustive. In Belgium and other flax-growing countries, where land has been under cultivation for generations, stable manure, which has been well rotted to avoid the danger of fouling the land with weeds, is applied before winter sets in. Previous to sowing time in spring the ground is heavily treated with fertilizers.

Flax demands a greater amount of labor than almost any other crop, and unless extreme care be exercised in every step the value of the crop for fibre will be seriously impaired. Much depends on the thickness of sowing. For a fine fibre flax must be sown thickly and be pulled before the seed is ripe; for a coarse fibre it may be given more room and the seed allowed to reach approximate maturity, but not the hard stage known as "dead ripeness." Coarse fibre and a crop of seed are often preferred by the grower to a crop of fine fibre alone, a departure that experience at home and abroad will countenance, especially since the disproving of the assertion that good fibre and seed cannot be produced by the same plant. Still, flax should be grown with a view of getting from the land a fine quality of fibre, while the seed, which ought to be a factor of profit, should be saved. Usually the crop is pulled, roots and all, by hand, but if the ground be smooth it may be cut with a mower, the implement used when seed alone is passed through an ordinary threshing machine; but since this tangles and breaks the fibre, it must not be used if the fibre is to be saved.

Dressing. The process first gone through after pulling is *rippling*, which consists in tearing off the seeds by pulling the stalks through a flax comb, which consists of a series of iron teeth 18 inches long, placed within a distance of $\frac{1}{2}$ inch of each other. These are fastened in a block of wood, which is placed at the end of a plank or long stool, on which the operator sits. Often the seeds are separated from the stalk by threshing or hammering, but this process, as already stated, is objectionable, as it soils and breaks the stalk. The next process is to obtain the flaxen fibre or lint, free from the woody core, or *boon*, of the stem. This is effected by steeping the bundles in either stagnant or running water till the boon begins to rot, in which state it is readily separated from the fibre. The operation is called *rotting*, or *retting*, and requires to be managed with great care, as by continuing it too long decomposition might extend to the fibre and render it useless; while by discontinuing it too soon the separation could not be effected with sufficient ease. The time is generally determined by the nature and temperature of the water and the ripeness of the flax, decomposition taking place more rapidly in soft, stagnant water than in running streams, in which the retting is sometimes conducted. Three natural modes of steeping, or retting, the straw are recognized—dew retting, pool retting, and retting in running water. There are also many processes for quick retting, where the temperature of the water is controlled, and also where cereals are used; but the flax of the world is largely retted by natural methods rather than by "processes." For dew retting a moist meadow is the proper place, the fibre being spread over the ground in straight rows at the rate of a ton to an acre. For pool retting the softest water gives the best results, and where a natural pool is not available, such as the "bog holes" in Ireland, "steep holes" are made. The sheaves are kept entirely under water, but without touching the bottom. The fibres sink when decomposition has been carried to the proper point. If the woody portion or core pulls out easily, leaving the fibre intact, it is ready to come out. The operation usually requires from 5 to 10 days. Dew retting is the safest and least offensive method, but it requires much longer time,

and in a country where land is valuable would become very expensive. On the whole, the mixed method of retting is preferable—i.e., to steep till decomposition of the boon is well advanced and then to complete the process on the grass. It has been attempted to separate the fibre by machinery without subjecting the flax to retting; but the article so produced has hitherto been rejected as inferior in quality.

Attempts to hasten the process of retting by placing the flax in tanks and using warm water or steam instead of cold water or dew have been more successful. According to the process introduced by Schenk, the flax is placed in vats, in which it is kept down by means of strong framework. Water is allowed to pass into the vats, to become absorbed by the flax; steam is next admitted, till the temperature of the water is raised to, and maintained at, about 90°. Acetous fermentation ensues in a few hours, and after being maintained for about 60 hours, the decomposition of the gummy or resinous matter in the stalk is completed. The mucilage water is next withdrawn from the vat, and the flax taken out, separated, and dried, either in the open air or in desiccating rooms, according to circumstances. Retting in water is usually followed by bleaching on the grass, to secure an even color. This is often accomplished in a few days, but may require several weeks.

The whole process of retting is a typical fermentation. A disagreeable odor arises from the fermenting flax, and the liquid, after the fermentation, is filled with products which make valuable manure. The bacillus which produces the retting has been identified, and it has been shown that the retting is a process of decomposition of the pectin cement. No method of separating the linen fibres in the flax from the woody fibres has yet been devised which dispenses with the aid of bacteria. (See Conn, *Story of Germ Life*, New York, 1900.) In chemical retting, however, dilute sulphuric or hydrochloric acid is used, which completes the process in a few days.

The flax is now ready to be freed completely of its woody particles. This is effected by *scutching*. Previous to this, however, the flax is passed through a *brake*, or revolving rollers, in order thoroughly to crack the boon. The brake, worked by manual labor, consists of a frame, on the upper side of which are a number of grooves; a movable piece is hinged at one end and provided with a similar grooved piece on its lower side, but so placed that the projections pass into the hollows of the lower. The flax, placed between these and struck by bringing down the hinged part, is broken, but the fibre remains uninjured.

In the flax-breaking machine the flax is passed through a series of horizontal fluted rollers; the flutes do not touch, thus preserving the fibre while breaking the boon. In Austria and other European countries a more primitive, but, it is claimed, less injurious method of breaking is pursued, in which the fibre is opened with a "bott hammer" (batting hammer), which is made of wood ridged like a cook's implement for pounding steak. In continental countries scutching is almost invariably performed by hand, the flax being held in a groove made in an upright stand and struck by a flat blade. Machine scutching is much more certain and expeditious than hand scutching and is, in consequence, fast superseding it in Great Britain. After passing

through the breaking machine the flax is subjected to the action of a series of knives attached to the arms of a vertical wheel; these knives strike the flax in the direction of its length. The process is gone through three times before the flax is ready for the market. Although machine scutching is expeditious, it is not capable of that pliant adaptation to the varying nature of the flax to be operated upon, which is obtained in hand scutching. The effect of machine scutching is to produce fineness by reducing and imparting rather than sustaining the character of the fibre—viz., the length and fineness of its "staple," or fibre. In the chapter on "The present Status of Flax Culture," in the *Year Book of the United States Department of Agriculture for 1897*, the statement that a practical machine scutcher is a desideratum still holds good, although many such machines have been invented.

The initial processes of linen manufacture thus far described are usually performed by the farmer, although there is a tendency within recent years for the preliminary work of retting, bleaching, breaking, and scutching to be performed by companies, who buy the straw direct from the fields and prepare it for the linen factory. The next step that the flax undergoes is that of heckling, the object of which is to separate the longer and better portion of the fibre, called "line," from the shorter and raveled portion, called "tow." The hand heckle is a many-toothed steel comb, and the fineness of the flax increases with the number of times it is heckled, each time with a finer and finer instrument. Heckling is now usually performed by machinery. (See HECKLE.) The fibre is then in readiness for spinning and for manufacture into linen, for which operations see the articles on SPINNING and LINEN.

The world's annual production of flaxseed averaged about 75,000,000 bushels per annum prior to 1900, about 100,000,000 per annum from 1900 to 1911, and was 130,000,000 in 1912. The production is about equally divided among five countries,—the United States, Canada, Argentina, India, and Russia,—the product of 1912 being: United States, 28,073,000 bushels; Canada, 26,130,000; Argentina, 22,518,000; India, 25,680,000, and Russia in Europe, 22,177,000. Little effort is made in the United States to utilize the fibre, the plant being grown almost exclusively for its seed. In 1913 the United States produced 17,853,000 bushels of flaxseed on 2,291,000 acres. Over 7,000,000 bushels were produced in North Dakota, where more than double that quantity has been secured in more favorable seasons. The record production of the United States is 29,285,000 bushels. Consult: Dodge, *Dictionary of the Fibre Plants of the World* (Washington, 1897); also "Fibre Investigations," in *United States Department of Agriculture, Report No. 9* (ib., 1897); "Flax for Seed and Fiber," *United States Department of Agriculture, Farmers' Bulletin 27*. See FIBRE.

FLAX, FALSE. See GOLD OF PLEASURE.

FLAX, NEW ZEALAND. A valuable fibre, quite different from common flax, obtained from the leaf of a lily-like plant, *Phormium tenax*, sometimes called harakeke. It is a perennial belonging to the family Liliaceæ, a native of New Zealand and Norfolk Island. Its leaves are from 2 to 6 feet long and 2 to 3 inches broad; the flowers brownish yellow; the fruit a three-cornered capsule with numerous compressed jet-

black seeds. The fibre of the leaves, which is both very fine and very strong, was used by the New Zealanders for making dresses, ropes, twine, mats, cloth, etc., before the discovery of New Zealand by Europeans. New Zealand flax thrives best on rich lowlands near rivers and in such places is used in its native country for making twine and ropes. It is also grown to some extent in California, and its cultivation has been attempted in parts of Europe; but the winters, except in the south, are too cold for it. To obtain the fibre the leaves are cut when they have attained their full size and are usually macerated in water for a few days. The New Zealanders formerly procured the fibre in its greatest perfection—very long and slender and shining like silk—by a more laborious process, without maceration. They removed the epidermis from the newly cut leaf, separating the fibres with their thumb nails and then more perfectly by combs. Large manufactories are now constructed, wherein the fibre is stripped by machinery. The best lands yield 10 tons per acre of sun-dried leaves, which produce 1200 pounds of fibre and 80 pounds of tow. See FIBRE.

FLAXMAN, JOHN (1755-1826). A leading sculptor of the English school and a draftsman. He was born at York, July 6, 1755, the son of John Flaxman, a modeler and maker of plaster casts in London. His health was delicate, and he had little early education. The most powerful and perhaps the earliest impulse which he received toward art appears to have been derived from two customers of his father, the painter Romney and a Reverend Mr. Matthew. His familiarity with the ancient poets begins at this time. Flaxman showed precocious talent for modeling in clay and drawing and entered the school of the Royal Academy in 1770, the second year after its foundation. He exhibited in the same year, and won a silver medal. In the competition for the gold medal in 1772 he was not successful.

Flaxman's actual career begins with his engagement in the pottery of Josiah Wedgwood in 1775. England was at this time thoroughly impregnated with the love of antiquity, prevalent in the latter part of the eighteenth century. Wedgwood was one of the leaders in the movement toward the realization of antique conditions, and Flaxman was inspired with the same devotion.

Flaxman's work for Wedgwood was usually confined to small reliefs. As processes of manufacture improved, however, more ambitious performances were undertaken, e.g., large bas reliefs for chimneypieces in 1776, a large tablet of "Apollo and the Muses" in 1777, etc. During this early part of his life he was intimately associated with William Blake. The influence of Flaxman's sense of outline and proportion often appears in the painter's works; and the flavor of Blake's mysticism may be detected in the works of the sculptor.

In 1782 Flaxman established an independent studio in Wardour Street, London, and married Anne Denman. In 1787 he went to Rome, which was then under the influence of the school of archaeologists and sculptors of which Winckelmann was the head and Canova and Thorvaldsen the leading practical workers. The prevailing interest was classical, the art of the Renaissance being entirely neglected. Flaxman's most important works in Rome were the superb

series of outline illustrations to Homer's *Iliad* and *Odyssey*. The plates to Æschylus and Dante appeared later. These drawings, made under the need of breadwinning, and the outline illustrations to Hesiod, published in 1817, have become the best known, and are certainly the most interesting and characteristic of Flaxman's productions. His chief works of sculpture in Rome were a group of "Cephalus and Aurora," for Thomas Hope, and a restoration of the Belvedere "Torso of Hercules," which he conceived to be part of a group of two figures, "Hercules and Omphale." This piece was afterward destroyed. While in Rome he made a large collection of plaster casts for the painter Romney. Flaxman returned to England in 1794. In 1797 he was elected associate, in 1800 a full member, and in 1810 professor of sculpture, at the Royal Academy. His lectures, 10 in number, were published in 1829.

Flaxman died Dec. 7, 1826, and is buried in the church of St. Giles-in-the-Fields, London. Casts of the principal of his very numerous works have been collected in a special museum in University College, London. Among the most important of his funeral reliefs, scattered throughout the churches of England, in which he is seen to better advantage than in his heroic sculptures, are the monuments to Lord Mansfield, in Westminster Abbey (1796), and to Sir William Jones, in the church of St. Mary's, Oxford (1797); several monumental works for the East India Company; and the monument to Captain Montague, in Westminster Abbey (1802). He projected but did not execute a colossal statue of "Britannia," 200 feet high, to be placed on Greenwich Hill (1800). He designed also the monuments to the Baring family in Micheldever Church, Hampshire (1811); to Sir Joshua Reynolds in St. Paul's (1807); to Lord Cornwallis for Prince of Wales Island (1812); and to Sir J. Moore in Glasgow (1813). Among his ideal works are a tripod executed by the goldsmiths Rundell and Bridge, and presented to John Kemble in 1817; a charming but unheroic realization of Homer's "Shield of Achilles," which was made in silver gilt and bronze by the same artisans (1818); a pedimental group in marble for the Duke of Bedford's sculpture gallery at Woburn (1820); a group of "Maternal Love" for the monument to Mrs. Fitzharris (1817); the great group of "Saint Michael and Satan" (1821); and "The Pastoral Apollo" (1824). But it is in his drawings, both outline illustrations and studies, that his genius finds most charming and characteristic expression. The most extensive public collections of these are in University College, the British and South Kensington Museums, London, and the Fitzwilliam Museum, Cambridge. Consult: Cunningham, *Lives of the Most Eminent British Painters, Sculptors, and Architects* (London, 1830-33); Meteyard, *The Life of Josiah Wedgwood* (ib., 1865-66); id., *Choice Examples of Wedgwood Art from Designs of Flaxman* (ib., 1879); *The Drawings of Flaxman, with Introduction and Descriptions by Colvin* (ib., 1876); Scott, *The British School of Sculpture* (ib., 1872); Doin, in *Gazette des Beaux-Arts* (Paris, 1911, ser. 4, vol. v); and Colvin, in *Dictionary of National Biography*, vol. xix (London, 1889).

FLAX/SEED. Both the seed and the oil are used in medicine. The seed contains a viscid, fixed oil, 30 to 35 per cent, mucilage

15 per cent, proteids 25 per cent, and a minute quantity of amygdalin. Linseed oil is a fixed oil expressed from the seed without the use of heat. It is a yellowish, oily liquid, having an odor peculiar to itself, and a bland taste when fresh. Its principal ingredients are linolein, myristin, palmitin, and a high percentage of albumin, to which its drying properties are attributed. Linseed tea, made by boiling together 3 parts of linseed, 1 part of licorice, and 100 parts of water, is a common domestic remedy for slight colds and sore throats. It is soothing, demulcent, and mildly diuretic. The seed itself is also used to make poultices, 4 parts of the seed being mixed with 10 parts of boiling water. It is used to relieve pain, to hasten the formation of abscesses, and as a counterirritant in deep-seated inflammation. Linseed oil mixed with an equal quantity of lime water forms Carron oil (q.v.), a common remedy for burns.

FLEA (AS. *fleaþ*, Icel. *fló*, OHG. *flôh*, Ger. *Floh*; connected with OHG. *fliohan*, Ger. *fiehen*, to flee, AS. *fleon*, Icel. *flija*, Goth. *fliahan*). One of the small wingless insects now commonly regarded as constituting a distinct order, Aphaniptera or Siphonaptera, containing a single family, Pulicidæ. All the species are very similar to the common European flea (*Pulex irritans*), which is plentiful in most parts of the Old World and lives by sucking the blood of man and of certain quadrupeds and birds. It abounds particularly in the nests of poultry, pigeons, and swallows, and wherever dust accumulates in the chinks of floors, etc., and it is to be found also plentifully in beds wherever cleanliness is neglected. The abundance of fleas in some hot sandy countries is an intolerable nuisance to both travelers and residents. The female is rather larger and stronger than the male, but the sexes are otherwise very similar. The head is small, very compressed, rounded above, and has on each side a small round eye. The mouth has two lancet-like mandibles, the maxillæ being represented by two conical scales, the mandibles and the maxillæ forming a suctorial beak, with a slender, bristle-like tongue, the whole inclosed between two three-jointed plates. The thorax consists of three segments, the second and third of which bear a scale on each side, regarded as rudimentary wings. There is no marked division between the thorax and the abdomen, which consists of nine segments, much larger than those of the thorax, but much compressed. The whole body is covered with a tough integument. The activity of the flea, its power of leaping, and its extraordinary strength are well known. Its strength has been sometimes applied to the drawing of miniature carriages, cannon, etc. Fleas undergo a complete metamorphosis. The female lays about a dozen white eggs, slightly viscous. The larva is long and slender, at first white; afterward reddish, and destitute of feet. It subsists upon animal particles in dust and upon the loosened particles of skin caught among an animal's hairs. When about to change into a pupa, it incloses itself in a little silk cocoon, from which emerges the perfect flea. Cleanliness and careful attention are the principal means of keeping beds and houses free of fleas; but where these are found insufficient, a free use of kerosene is recommended. The common flea of households in the United States is that of the cat and dog (*Pulex serraticeps*). The flea prevalent upon human beings in the Old World (*Pulex irritans*) is rarely seen in America. Squirrels,

foxes, rats, and some other animals have separate species, of which in all about 100 are known, a third of which are American. Fleas have been accused of spreading disease, Grassi alleging that the cat-and-dog flea is an intermediate host for tapeworms; and certain others may carry the bubonic plague. Consult Doane, *Insects and Disease* (New York, 1910), and Russel, *The Flea* ("Cambridge Manuals," Cambridge, 1913). See CHIGOE.

FLEA-BANE. A common name applied in the United States to plants of the genus *Erigeron* (q.v.) and in England to those of *Pulicaria*, which belong to the family Compositæ. The whole plant emits a peculiar aromatic smell, which is said to be efficacious in driving away fleas and other insects. Two species are found in England, one of which, *Pulicaria dysenterica*, common in most places, has oblong leaves, a cottony stem 12 to 15 inches high, and panicked flowers. It has been used in diarrhœa and dysentery. The name "fleabane" is also applied to a species of an allied genus, *Conyza squarrosa*.

FLEA BEETLE. Any of many of the smaller leaf beetles of the family Chrysomelidæ, so called on account of their activity in jumping, and characterized by the great thickening and muscularity of the hind femora. They were formerly grouped under the name *Haltica*, but are now divided into the genera *Psylliodes*, *Dibolia*, *Phyllotreta*, *Galeruca*, *Diabrotica*, and their allies. Many of them do vast damage to shade trees and farm crops. See LEAF BEETLE, and the accounts of insects affecting the MELON, GRAPE, TURNIP, ETC.

FLEA LOUSE. A plant louse of the family Psyllidæ, having "two-jointed tarsi, antennæ eight or nine jointed, and the hind legs with somewhat swollen thighs," enabling them to leap vigorously, as other plant lice do not. Many forms make galls, others secrete honeydew; and they live upon certain trees, which they damage seriously. One species (*Psylla pyricola*) is a pest of pear trees in the northwestern United States. Consult Riley, "Notes on American Psyllidæ," in *Proceedings of Biological Society of Washington*, vol. ii (Washington, 1884). See PEAR INSECTS.

FLEANCE, flē'ans. The son of Banquo, in Shakespeare's *Macbeth*. Macbeth instigates an attempt against his life in fear that the witches' prophecy will be fulfilled, and that he will come to the throne of Scotland.

FLÈCHE, flēsh, LA. The capital of an arrondissement in the Department of Sarthe, France, situated on the right bank of the Loir, 24 miles south-southwest of Le Mans (Map: France, N., E 5). It has a town hall, a theatre, and a museum, and is celebrated for the Prytanée military school (founded 1774), with its library of 20,000 volumes, situated in an old Jesuit college built by Henry IV. It is a preparatory school for Saint-Cyr. Among famous alumni of the former college have been Prince Eugène, Descartes, and Picard, the astronomer. La Flèche has some trade in corn, hay, and wine, also manufactures of oil, paper, bicycles, leather, and gloves. Pop. (commune), 1901, 10,519; 1911, 10,830.

FLECHERE, JOHN WILLIAM DE LA. See FLETCHER, JOHN WILLIAM.

FLÉCHIER, flā'shyā', VALENTIN ESPRIT (1632-1710). A French ecclesiastic. He was born at Pernes, near Avignon, and educated in the Collège of the Congregation of Christian

Doctrine at Tarascon. In 1659 he went to Paris and taught for a time, but soon gave himself entirely to preaching. He won great fame as an orator, and particularly by his funeral orations, among which that on Marshal Turenne (1676) is considered his masterpiece. That on Madame Montausier secured his admission to the Academy at the same time with Racine (1673). He also wrote poems in French and Latin, and political compositions, among which were the *Carmen Eucharisticum* (1660), celebrating the Peace of the Pyrenees; *Circus Regius* (1662), describing a tournament given by Louis XIV; and *Mémoires sur les grands jours de Clermont* (first published in 1844), in which he relates in half romantic and half historic form the proceedings of that extraordinary court of justice. In 1685 he was appointed Bishop of Lavaux, and in 1687 of Nîmes. The Edict of Nantes had been revoked two years earlier, and Calvinists were still numerous in the bishopric. In the troublous times which followed he softened, to the utmost of his power, the rigor of the edicts, and showed himself so sensible to the evils of persecution and so indulgent even of what he regarded as error, that his memory was long held in veneration by the Protestants of the district. In the famine which followed the winter of 1709 he assisted all in his diocese without regard to their religious tenets, declaring that all alike were his children. His works appeared at Nîmes (10 vols., 1782) and at Paris (2 vols., 1856). His funeral orations have been often printed (an edition by Fabre, Paris, 1886); that on Marshal Turenne may be found in English in Fish, *History and Repository of Pulpit Eloquence* (New York, 1856), and in Lee, *The World's Orators*, vol. iv (ib., 1900). For his life, consult Delacroix (3d ed., Paris, 1883).

FLECHSIG, flēk'zík, PAUL EMIL (1847-). A German physician. He was born at Zwickau and was educated at the University of Leipzig, where he was appointed professor of psychiatry in 1884. His close personal investigations of the various European systems for the treatment of insanity secured for him an appointment in 1882 as director of the Clinical Institute of Psychiatry and Neurology at Leipzig, on the organization and management of which he subsequently published the work entitled *Die Irrenklinik der Universität Leipzig in den Jahren 1882-86* (1887). There is an area in the spinal cord known as Flechsig's Oval area. His original investigations on the structure of the brain are embodied in the work entitled *Die Leitungsbahnen im Gehirn und Rückenmark des Menschen auf Grund entwicklungsge-schichtlicher Untersuchungen dargestellt* (1876).

FLECK, EDUARD (1804-79). A Prussian writer on military law, born at Pforten, Lower Lusatia. After serving as auditor of the garrison at Magdeburg, he was appointed general auditor of the Prussian army in 1857. In 1876 he was invested with the rank of lieutenant general. He was long an instructor in the Military Academy at Berlin and during a period of more than 30 years assisted in the formation of nearly every important military law enacted in Prussia. His works, which relate chiefly to military jurisprudence, comprise the following: *Erläuterungen zu den älteren preussischen Kriegsartikeln* (latest ed., 1850); *Die Verordnungen über die Ehrengerichte im preussischen Heer* (3d ed., 1865); *Kommentar über das*

Strafgesetzbuch für das preussische Heer (latest ed., 2 vols., 1869); *Militärstrafgesetzbuch für das deutsche Reich* (1875; 2d ed., 1880).

FLECK, JOHANN FRIEDRICH FERDINAND (1757-1801). A noted German actor of the National Theatre at Berlin. He was born at Breslau and in youth studied theology, for a time attending the University of Halle. Having joined a theatrical troupe, however, at Leipzig in 1777, he went, two years later, to Hamburg, where he became very successful. He made his appearance at Berlin in 1783. Among his celebrated characters were Karl Moor, Götz, Lear, Shylock, and Wallenstein.

FLECKEISEN, fläk'i-zen, CARL FRIEDRICH ALFRED (1820-99). A German classical scholar, born in Wolfenbüttel (Brunswick). He studied at the University of Göttingen and was connected with educational institutions at Frankfurt-on-the-Main and at Dresden, where from 1861 until his retirement in 1889 he was associate principal of the Vitzthum Gymnasium. From 1855 he was editor of the department of classical philology in Jahn's *Jahrbücher für Philologie und Pädagogik*. His publications include *Kritische Miscellen* (1864); a recension of Halm's text edition of the *Vita* of Nepos (last impression, 1898); a standard critical edition of Terence (1857; revised and enlarged, 1898); *Exercitationes Plautinae* (1842), a scholarly discussion of the language of Plautus; an edition of the text of 10 plays of Plautus, to which was prefixed an *Epistula Critica ad F. Ritschelium* (1850-51); *Fünfzig Artikel* (1861). His best work was on Plautus and Terence; here he had no superior save Ritschl (q.v.). Consult Götz, in Bursian's *Biographisches Jahrbuch für Altertumskunde*, vol. xxiii (Leipzig, 1900).

FLECKNOE, fläk'nó, RICHARD (?-c.1678). An English versifier of the seventeenth century, about whom very little is known. It is said that he was an Irishman and a Roman Catholic priest, and according to his own account he traveled much in Europe, Asia, Africa, and America, wanderings which he described in *A Relation of Ten Years' Travels* (1656). His writings, consisting of plays, epigrams, and miscellaneous poems, are no longer read even by scholars; and in his own time he was the type of a dull and tiresome versifier. As such, he was immortalized in Dryden's *Mac Flecknoe* (1682).

FLEE FROM THE PRESS. A poem ascribed to Chaucer, before 1532, but attributed by many later critics to John Lydgate. It is sometimes known as the *Balade of Goode Counseil*.

FLEET, THE. A small creek, anciently called Fleta, rising near Hampstead Hills and passing near the west wall of London City. Its lower portion was navigable at the time of Edward I, but it is now arched over and converted into one of the large city sewers, discharging into the Thames at Blackfriars Bridge. Its pestilential condition when the water was diverted is described by Jonson, Pope, Swift, Gay, and other writers.

FLEET MARRIAGES. Irregular and clandestine marriages, celebrated in the Fleet Prison and vicinity towards the end of the seventeenth and during the eighteenth century. The Fleet Prison naturally had its chapel where regular marriages could be contracted; and there is no reason for believing that the earliest recorded

marriages in the Fleet (1613-74) were in any way irregular. But in the latter half of the seventeenth century clandestine marriages became very common in England, owing to the great expense of the public ceremony. In many of the churches marriages were performed without license or banns. By an Act of 1696 (17 and 18 Wm. III, c. 35, §§ 2, 3) a penalty of £100 was imposed upon any clergyman who married or permitted another to marry couples otherwise than by banns or license. This act partially checked clandestine marriages in the Fleet Chapel, but it had no restraining influence upon the debtor clergymen of the prison, for whom the penalty of a fine could have no terrors. Accordingly it came to be common for those who desired to be married in secret to resort to the Fleet. Irregular clergymen and even laymen gathered in the vicinity to share in the business of performing marriage ceremonies. They opened offices in alehouses and barber shops and employed "pliers" or "touts" to secure the custom of those desiring their services. A scandalous competition arose in which these clergymen strove to outdo one another in laxity in order to increase their business. Registers of marriages were kept and manipulated to suit the desire of the contracting parties. Youths were enticed into marriage with persons of low degree; bigamous marriages were connived at by the clergyman, who thus gained an additional fee. The abuses of the system, in short, would be beyond credence were they not attested by a vast amount of evidence.

These marriages were not illegal, since before the Act 26 Geo. II, c. 33, there was no necessity in England for any religious ceremonial in the performance of a marriage, which might be contracted by mere verbal consent. But those who had contracted a Fleet marriage had no evidence of the fact. The Fleet parsons kept registers, indeed, but they were so notoriously falsified that they were not received as evidence in courts of law (*Doe I. Davies v. Gatacre*, 8 Carr and P. 578). Thus innocent parties were frequently involved in the greatest hardships. Finally conditions became so intolerable that it was necessary to sweep away the whole system. The 25 Geo. II, c. 33, declared void all marriages in England that should be solemnized otherwise than in a church or public chapel where banns had been published, unless under a special license. The Fleet marriage disappeared when this act went into force. Consult Burn, *History of Fleet Marriages*, and Ashton, *The Fleet* (London, 1889).

FLEET PRISON. A celebrated London jail, which stood on the east side of Farringdon Street, on what was formerly called Fleet Market. The keeper of it was called the warden of the Fleet. It derived its name from the Fleet rivulet (so named from its rapidity), which flowed into the Thames. In 1842 the separate jurisdiction anciently vested in the wardens of the Fleet and the Marshalsea was abolished, and their functions transferred to the Court of Queen's Bench, the Fleet being thenceforth known as the Queen's prison. The Fleet was the royal prison as far back as the twelfth century. The followers of Wat Tyler burned it in the reign of Richard II. In the sixteenth and seventeenth centuries it acquired a high historical interest from its having been the prison of the religious martyrs of the reigns of Mary and Elizabeth, and of the political victims of

the courts of the Star Chamber and High Commission in that of Charles I. On the abolition of the Star Chamber, in 1641, the Fleet became a place of confinement for debtors and persons committed for contempt by the courts of Chancery, Exchequer, and Common Pleas. During the eighteenth century it was the scene of every kind of atrocity and brutality, from the extortion of the keepers and the custom of permitting the warden to underlet it. The Fleet was several times rebuilt; the last building was erected after the burning of the older one in the Gordon riots of 1780, the predecessor of which had been destroyed in the great fire of London in 1666. Latterly it usually contained 250 prisoners, and kept ward of about 60 outdoor *détenus* for debt privileged to live within the rules. See DEBTOR.

FLEET STREET. An old street of London, which takes its name from the Fleet stream; formerly a favorite place for shows and now noted for its banking, newspaper, and printing offices. Consult W. G. Bell, *Fleet Street in Seven Centuries* (New York, 1912), and E. B. Chancellor, *Annals of Fleet Street* (ib., 1912).

FLEETWOOD, or FLEETWOOD-ON-WYRE. A seaport and military station in Lancashire, England, on the estuary of the Wyre, about 20 miles southwest of Lancaster (Map: England, C 3). It was planned and founded in 1836 by Sir Peter Hesketh Fleetwood, in whose honor it was named, and is a favorite resort for sea bathing. It has a fine harbor with extensive docks and an important shipping trade. The town owns its tramway service (which it acquired in 1909), electric-lighting works, slaughterhouses, and other public utilities. Pop., 1901, 12,082; 1911, 15,876.

FLEETWOOD, CHARLES (?-1692). An English parliamentary soldier. He was studying at Gray's Inn at the outbreak of hostilities between Charles I and the parliamentary forces and joined the latter, enrolling in 1642 as a private trooper in the life guard of the Earl of Essex, but was promoted rapidly and was colonel of a regiment of horse at Naseby. In 1646 he entered the House of Commons. In the quarrel between Parliament and the army in 1647 he was one of the officers appointed by the army to treat with the parliamentary commissioners. He took no part in the King's trial, but was made Governor of the Isle of Wight in 1649, accompanied Cromwell to Scotland in 1650, participated in the battle of Dunbar, and in 1651 became a member of the Council of State and as a lieutenant general commanded the cavalry at the defeat of Charles II at Worcester. In 1652 he married Cromwell's daughter, Bridget, the widow of Ireton, and was made commander in chief of the parliamentary forces in Ireland, where he stayed until 1655, the last year with the rank of Lord Deputy. He ardently supported the proclamation of the Protectorate. His rule in Ireland was not a success, and Cromwell recalled him, although he continued to hold the title of Lord Deputy until succeeded by Henry Cromwell in 1657. In 1655 Fleetwood was one of the major generals appointed to look after the interior administration of the realm. He opposed the proposal to make Cromwell King, was a member of the newly constituted House of Lords, and supported the Protector in his later quarrels with Parliament and in his foreign policy. After Cromwell's death he was accused of attempt-

ing to succeed him as Lord Protector, and possibly was Oliver's choice. Although he gave his support to Richard Cromwell, he was constantly the centre of the army intrigues to supplant him. He was commissioned commander in chief of the army in 1659. He took no part in the restoration of Charles II, but did not oppose it, and as a result was included in the Act of Indemnity, being incapacitated from holding office. He lived for 32 years after the Restoration, but did not again take part in public affairs.

FLEETWOOD, GEORGE (?-c.1665). An English parliamentary leader, born in Buckingham. In 1643 he raised a troop of dragoons for the Parliament. He represented his native shire in the Long Parliament (1647), and in 1649 he signed the death warrant of Charles I. Cromwell made him first a knight, then a lord. At the Restoration he was condemned to death as a regicide, but upon forswearing his former allegiance and furnishing proofs of repentance he was merely deprived of his estates. He probably spent the remainder of his life in America.

FLEETWOOD, GEORGE (1605-67). A general in the Swedish service, born at Cople, Bedfordshire, England. In 1629 with a troop of horse he joined Gustavus Adolphus in Germany, and in 1630 he raised an infantry regiment for him in England. He was knighted in 1632 and was made Baron by Queen Christina in 1654. In 1655 he was sent to London as Swedish Envoy Extraordinary. Two years later he was made lieutenant general and in 1665 a member of the Swedish Council of War. He married in Sweden (1640) and had two daughters and four sons. One of the latter became a soldier in the guard of Charles II. Consult Guernsey Jones, *The Diplomatic Relations between Cromwell and Charles X of Sweden* (London, 1897).

FLEETWOOD, JOHN. The name—probably a pseudonym—given as that of the author of *The Life of Jesus Christ and the Apostles*, first published in London in 1767 and many times reprinted. The work had an immense circulation and for nearly 100 years was the only life of Jesus read in religious families in English-speaking countries. It is now seldom read. *The Christian Prayer Book* (1772) and a *Christian Dictionary* (1773) are also attributed to the same author.

FLEETWOOD, WILLIAM (1656-1723). An English clergyman and author, born in the Tower of London and educated at Eton and at King's College, Cambridge. He took holy orders and became a noted preacher of his time. He was royal chaplain to William and Mary and was canon at Windsor under Queen Anne, who made him Bishop of St. Asaph (1708). In 1712 he published four funeral sermons and in his preface attacked the doctrine of nonresistance. The Commons ordered the book burnt; but by being printed in the *Spectator* (No. 384) the preface attained greater publicity. Nine years before his death he was elected Bishop of Ely, and he was buried in that cathedral. His nephew collected his sermons into a single volume with a brief memoir (1737). His *Essay on Miracles* (1701) provoked a reply (1702) from Bishop Hoadly; and these two essays called out John Locke's discourse on *Miracles* (1702).

FLEGEL, flä'gel, EDUARD ROBERT (1855-86); A German traveler, born at Vilna, Russia. In

1875 he became connected with the factory at Largos, Guinea, West Africa; in 1879 ascended and surveyed the Benue, and from that time on was unceasing in his efforts to open that river and the adjacent region to German trade. In 1882 he discovered the source of the Benue near Ngamudere, Kamerun. He visited Europe in 1884, obtained the support of the German African Society and of the Colonial Union, and was commissioned by the Emperor to present gifts to the Sultan of the powerful native State of Sokoto. When he returned, however, with the object of establishing trading posts in the district between the Niger and the Benue, he found that the territory had already been occupied by the English Niger Company. He was recalled to Europe in 1886, but died on the coast. He wrote *Loose Blätter aus dem Tagebuch meiner Haussafreunde* (1885) and *Vom Niger bis Benue; Briefe aus Afrika* (1890). Consult also *Mitteilungen der afrikanischen Gesellschaft in Deutschland*, vols. iv and v (Berlin, 1883-89).

FLEISCHER, *fish'ēr*, CHARLES (1871-). An American religious leader, born at Breslau, Germany. He came to the United States in 1880 and graduated from the College of the City of New York (A.B.) in 1888, from the University of Cincinnati (Litt.B.) in 1893, and as rabbi from the Hebrew Union College, Cincinnati, in 1893. From 1894 to 1911 he was rabbi of the Temple Israel, Boston, and thereafter was leader, in the same city, of the "Sunday Commons," an independent religious institution which he organized in 1911. He became known also as a lecturer and magazine contributor. He published *American Aspirations* (1914).

FLEISCHER, HEINRICH LEBERRECHT (1801-88). A distinguished German Orientalist, born at Schandau in Saxony. He studied theology and Oriental languages in Leipzig and later in Paris, under De Sacy and Caussin de Perceval, from 1824 to 1828. He began his career as teacher at a gymnasium in Dresden, to which post he was appointed in 1831, and while there catalogued the manuscripts in the Oriental department of the Saxon Royal Library. In 1835 he was appointed to a professorship of Oriental languages in the University of Leipzig, which he retained until his death, in 1888. Fleischer became the teacher of almost all the Oriental scholars in Germany during two generations, and his career marks an epoch in Oriental studies. He is principally known as an Arabist. His most important publications are: (1) Abulfeda, *Historia Ante-Islamica*, with notes and a Latin translation (1831); (2) an edition of *Ali's Hundred Sayings* (1837); and (3) an edition of Beidhawi's *Commentary on the Koran* (1844-48); and three volumes of *Beiträge zur arabischen Sprachkunde* (1863-84). In addition to this, he assisted in editing a large number of texts published by various scholars, made many contributions to Levy's *Aramaic and Talmudical dictionaries*, and in numerous other ways left an impress on Oriental studies in the nineteenth century. He was one of the founders of the German Oriental Society and a constant contributor to it and to the Royal Saxon Academy.

FLEISCHER, HERMANN ANTON MORITZ (1843-). A German agricultural chemist, born at Cleves, Prussia. He studied in Berlin, and after several years of service as assistant in various agricultural institutions, he was made

director of the Agricultural Experiment Station at Bonn in 1875 and of the Moor Station at Bremen in 1877. From 1891 to 1898 he was professor of chemistry and thereafter of moor culture at the Agricultural Institute of Berlin, and he remained connected with the Agricultural Experiment Station of Bremen in the capacity of curator. His published works include: *Die Thätigkeit der Central-Moorkommission* (1882); *Die Torfstreu, ihre Herstellung und Verwendung* (1900). He also published important contributions in the *Landwirtschaftliche Jahrbücher* and in the *Protokolle der Sitzungen der Central-Moorkommission*. For 10 years he was the editor of *Biedermanns Centralblatt für Agrikulturchemie*.

FLEISCHER, OSKAR (1856-). A German musical scholar and writer, born in Zörbig (Saxony). From 1878 to 1883 he studied philology at the University of Halle, where he received the degree of Ph.D. He then studied music under Spitta in Berlin. After three years of travel for the purpose of studying old manuscripts he was in 1888 placed in charge of the royal collection of musical instruments. In 1892 he established himself as docent of the science of music at the University of Berlin and in 1895 was made professor. In 1899 he founded the Internationale Musikgesellschaft, the publications of which he edited until 1904, and to which he contributed many important essays. His chief work is *Neumen Studien* in three volumes (1895, 1897, 1904), the result of original and profound research. He also wrote an excellent biography of Mozart (1899).

FLEISCHMANN, *fish'mán*, WILHELM (1837-). A German agricultural historian and chemist, born in Erlangen, and educated at Nuremberg, Würzburg, Erlangen, and Munich. In 1862 he began to work on agricultural chemistry in Liebig's laboratory. In 1864-67 he taught in the Realschule at Memmingen and conducted agricultural experiments there and in 1867-76 was rector of the Lindau Realschule. He was director in 1876-86 of the first German dairy experiment station, near Lalendorf in Mecklenburg; in 1886-96 of the Agricultural Institute at Königsberg; and after 1896 of a similar institute at Göttingen. His most important work was in the chemistry of milk and in the history of agriculture. His writings include: *Handbuch des Molkereiwesens* (1876); *Altgermanische und altrömische Agrarverhältnisse* (1906); *Lehrbuch der Milchwirtschaft* (1908; and in English and Russian versions); *Cäsar, Tacitus, Karl der Grösse, und die deutsche Landwirtschaft* (1911).

FLEMAL, *fl'mäl*, or **FLEMAEL**, BERTHOLET (1614-75). A Flemish historical and portrait painter, born at Liège. He studied under Trippez and Girard Douffet and then went to Rome and Florence, where he lived for several years. Upon his return he stopped in Paris, where he decorated the churches of the Grands Augustines and the Carmes Déchaussés. In 1649 he was employed in Brussels for the Swedish Queen. During a second visit to Paris in 1670 he was elected a member of the Royal Academy and shortly afterwards professor, and painted the ceiling of the Audience Chamber in the Tuileries. He was also the architect for several churches at Liège. Flemal is one of the best masters of the Liège school. His pictures are well composed, but weak in color and show the influence of Poussin. But few survive, among

the best of which are a "Crucifixion" in the cathedral, and paintings in several other churches in Liège; "The Punishment of Heliodorus," in the Brussels Museum; "Aeneas Leaving Troy," in the Dresden Gallery.

FLÉMALLE, flā'māl', Lē MAÎTRE DE. An important Flemish painter of the early fifteenth century, named from the Abbey near Liège where the first identified examples of his work were found. He is usually identified with Jacques Daret, a painter of Tournay, who is first mentioned in 1427 as a pupil of Robert Campin at Tournay at the same time as Rogier van der Weyden. Daret practiced chiefly at Tournay, where he was received into the painters' guild in 1432. He was active also at Lille (1454), Bruges (1468), and especially at Arras in 1433-35 and later. For the Abbot of St. Vaast at Arras he painted a large altarpiece, parts of which survive in the "Visitation" and "Adoration of the Magi," both in the Berlin Museum, a "Nativity" in the Morgan collection (Metropolitan Museum, New York) and the "Presentation in the Temple," the Tuck collection, Paris. He is last mentioned in 1468 as assisting in the festivals in honor of the marriage of Charles the Bold, Duke of Burgundy, at Bruges. But George Hulin de Loo has shown (*Burlington Magazine*, 1909, 1911) that Daret was probably a pupil of the Maître de Flémalle, who was no other than Robert Campin of Tournay. He was, after the Van Eycks, the most important master of his day. Technically his art was more archaic than theirs, but it possessed corresponding qualities of sincerity and naïveté. His most important work was a great triptych at Flémalle representing a "Descent from the Cross," of which four panels, viz., "The Holy Trinity," "Virgin and Child," "Gestas on the Cross," and "St. Barbara," survive in the Städel Institute, Frankfurt. Other panels by him are an "Annunciation with St. Joseph and Donors," Mérode collection, Brussels; "The Adoration of the Shepherds," Dijon Museum; a "Madonna and Child with Angels," Metropolitan Museum, New York; two small panels in the Johnson collection, Philadelphia; and "The Marriage of the Virgin" (1438) in the Prado (Madrid). Consult Houtart, *Jacques Daret* (Tournai, n. d.); Winckler, *Der Meister von Flémalle und Rogier von der Weyden* (Strassburg, 1913).

FLEMING, ABRAHAM (c.1552-1607). An English poet and antiquary, born in London. He was educated at Cambridge, was chaplain to the Countess of Nottingham and afterward rector of St. Pancras, Soper Lane, London. Besides being an enthusiastic collector of old manuscripts, he was an excellent translator of Latin and Greek into English verse, to which he frequently added original matter. His work in prose includes a digest of Holinshed's *Chronicles* and a history of English earthquakes (1580).

FLEMING, JOHN, LORD (c.1537-72). A Scottish lord, partisan of Mary Stuart. He succeeded to the title after the death of his brother James (1558), became Great Chamberlain in 1565 and Governor of Dumbarton Castle in 1567. He was with Mary at Langside and escorted her to Carlisle. She wished to send him to France, but Elizabeth would not permit this. Fleming withdrew to Scotland and held Dumbarton in Mary's name, in the hope of making an entrance possible for French troops; but

the castle was taken in 1571. He escaped and went to France, but was shipwrecked on his return with French soldiers to take up Mary's cause. He was accidentally shot (1572) when the French entered Edinburgh. His son, John Fleming, was first Earl of Wigton; he died in 1619 and was succeeded by another John, who died in 1650.

FLEMING, JOHN (1785-1857). A Scottish naturalist and preacher, born near Bathgate in Linlithgowshire. He was licensed as a minister, and preached in Fifeshire. He devoted most of his time, however, to the study of the natural sciences and by his scientific works soon became known as the first zoologist of Scotland. In 1834 he was appointed professor of physics at Aberdeen. Afterward he filled the chair of natural history at Edinburgh. As a naturalist, he is best known as the originator of the so-called dichotomous or binary system of classification, which he endeavored to establish in spite of strong opposition on the part of Cuvier and others. He published a number of interesting works, including: *Economic Mineralogy of the Zetland and Orkney Islands* (1807); *Philosophy of Zoology* (1822); and a *History of British Animals* (1828).

FLEMING, JOHN AMBROSE (1849-). An English physicist and electrical engineer. He was born at Lancaster, Nov. 29, 1849, and received his education in the University College School and University College, London. He was appointed professor of mathematics and physics at the University College, Nottingham, but resigned in 1881 to become electrical engineer to the Edison Electrical Lighting Company. In 1882 he was elected a member of the Institution of Electrical Engineers, of whose council he was for many years a member, serving as vice president, and was also a vice president of the Physical Society of London as well as a member of the Royal Institution. In 1911 he was Hughes medalist of the Royal Society. Professor Fleming was chosen a fellow of St. John's College, Cambridge, and a fellow of the University College, London. While not giving up consulting and expert work entirely, Professor Fleming in 1885 accepted an appointment as professor of electrical engineering in University College, where a fine laboratory was erected under his direction and a complete course in electrical engineering given. He was also appointed Pender professor of electrical engineering in the University of London. He was largely interested in founding the National Physical Laboratory. His investigations in radiotelegraphy were of great importance, and he contributed much to the theory and practice of the art. He delivered many popular lectures and read many papers before scientific societies. He published: *Short Lectures to Electric Artisans* (1885); *Treatise on the Alternate Current Transformer* (1889-92); *Electric Lamps and Electric Lighting* (1894); *Electric Laboratory Notes and Forms* (1894); *Magnets and Electric Currents* (2d ed., 1902); *Waves and Ripples in Water, Air, and Ether* (1902); *The Principles of Electric Wave Telegraphy and Telephony* (1906); *A Manual of Radiotelegraphy and Radiotelephony* (1908); *Propagation of Electric Currents in Telephone and Telegraph Conductors* (1911); *The Wonders of Wireless Telegraphy* (1913).

FLEMING, KLAS ERIKSSON (c.1535-97). A Swedish admiral and statesman. He was born

in Finland, of a family originally from Flanders. In 1561 he was appointed Governor of Esthonia by Erik XIV. He fought against Duke John (1563), but later went over to him and was made a peer and counselor in 1569, after John's accession to the throne. In the next year he commanded the army which repelled the Danes. Because of his personal valor and his high place in the kingdom, as well as because of his relation to Gustavus Vasa, whose sister-in-law, Ebba Stenbock, he had married (1573), he exerted great influence. In 1588 he was made grand admiral, in 1591 he commanded in the war with Russia, and until 1597 he was practically Regent of Finland. On the death of John III (1592) Fleming upheld the claim of Sigismund against Duke Charles, and at the end of the war with Russia refused to dismiss his soldiers and went with his fleet to Danzig to fetch Sigismund to Stockholm. After Sigismund's coronation (1594) Fleming was made Governor of Finland. He put down two peasant insurrections in east Bothnia (1596-97) and was preparing to attack Duke Charles, when he died.

FLEMING, or FLEMMING, PAUL (1609-40). A German poet. He was born at Hartenstein (Saxony), studied at the universities of Leipzig and Leyden, and in 1633-39 accompanied the embassy sent by Duke Frederick of Schleswig-Holstein to Moscow and Persia. His early work was in the manner of Martin Opitz (q.v.), whom he afterward greatly surpassed. He is not indeed wholly free from the volubility and artificiality characteristic of the verse of his time, but he displays more frequently than do his contemporaries sincerity and directness and easily outranks them all in poetic fervor. His collected poems, edited by his friend Adam Olearius, were published in 1646. The best subsequent edition is by Lappenberg (the Latin poems, 1863; the German, 2 vols., 1865) in Nos. 73, 82, and 83 of the *Bibliothek des literarischen Vereins*. Consult also: Varnhagen von Ense, *Biographische Denkmale*, vol. iv (3d ed., Leipzig, 1872); Straumer, *Flemings Leben und orientalische Reise* (ib., 1892); Wysocki, *De Pauli Flemingi Germanice Scriptis et Ingenio* (Paris, 1892); Bornemann, *Paul Fleming* (Stettin, 1899).

FLEMING, RICHARD (c.1360-1431). A bishop of Lincoln, born in Yorkshire and educated at University College, Oxford. There he came under the influence of Wiclif's teachings, declared for them as member of the commission of 12 appointed to see if they were heretical, and was very severely reprimanded by Archbishop Arundel in the matter. But later, and especially as Bishop of Lincoln (1420), he showed himself a zealous upholder of papal authority, was president of the English representatives at the Council of Pavia (1423), and championed the power of the Pope above that of the Council. On his return to England he was appointed by the Pope Archbishop of York (1424), but the King had already granted that office to the Bishop of Worcester, duly elected by the chapter, and Fleming had to give up his claim. In 1427 he began to plan a new college at Oxford, especially to hinder the spread of heresy and error; but Lincoln College was not founded till after his death. He is best known in episodic history because he exhumed Wiclif's body, burned it, and threw it into the Swift. He is mentioned by Bale as author of *Super Anglice Etymologia*, but this is lost if it ever existed.

FLEMING, SIR SANDFORD (1827-). A Canadian civil engineer, scientist, political reformer, and imperialist. He was born in Kirkcaldy, Fifeshire, Scotland, where he received his early education and first studied surveying. Coming to Canada in 1845, he joined the engineering staff of the Northern Railway and in 1857 became its chief. In 1863, while the settlers of the Red River valley (now part of Manitoba) were still living under the régime of the Hudson's Bay Company, he was chosen to urge the British government to promote railway communication between the Red River and eastern Canada. On his return he was appointed to survey the first part of a railway to extend from the Atlantic to the Pacific and wholly within British territory. The result was the Intercolonial Railway, of which he was chief engineer, and whose construction he completed in 1867-71. In 1872, as chief engineer of the Canadian Pacific, he led an exploring expedition across the continent to the British Columbia coast, and during 1873-77 he located the route of that railway through the Yellowhead Pass. While thus engaged, he also procured at his own expense surveys of Newfoundland which resulted in the railway afterward built and operated by Sir Robert Gillespie Reid (q.v.). These services made him the chief engineering figure in the continental railway construction so necessary to the political coherence of Canada. They were subordinate, nevertheless, to his aim of promoting consolidation of the Empire by linking the overland telegraphs on British soil to a system of all-British, state-owned submarine cables. In 1879 he submitted to the Canadian government a scheme for a British Pacific cable. Its essential features were adopted and subsequently realized in the cable completed in 1902, which connects Great Britain, Canada, Australia, and New Zealand. Fleming's imperialistic motive, while grounded on telegraphic communication as a means of defense, included also the unifying interchange of thought between the different parts of the Empire. Of this proof is afforded by the memorial tower near Halifax, built to commemorate the origin and benefits of Canadian representative government first established there. In 1880, when he retired from the service of the Dominion government, Fleming resumed his investigation of universal or cosmic time, with the object of establishing a standard system (see *TIME, Standard*) whose application to railway schedules would bring order out of confusion. His system was approved by various scientific societies, was sanctioned by international action at Washington in 1884, and has since been largely adopted throughout the world. In 1880 he became chancellor of Queen's University, Kingston, a position which he held continuously thereafter, being reelected for another three years' term in 1914, when he was 87 years old. He was a delegate to the colonial conferences in London, 1887, and in Ottawa, 1894; also a delegate to several international scientific conventions, and a member of many learned societies. He was one of the founders of the Canadian Institute and in 1888 was president of the Royal Society of Canada. Although not identified with any political party, he took a deep interest in and wrote ably on questions of representation and electoral reform. In 1897 he was made Knight Commander of the Order of St. Michael and St. George. His publications

include: *The Intercolonial: A Historical Sketch* (1876); *Daily Prayers for Busy Households* (1879); *Uniform Standard Time* (1881); *A Cable across the Pacific* (1882); *The Prime Meridian Question* (1884); *Expeditions to the Pacific* (1889); *Parliamentary vs. Party Government* (1891); *On the Rectification of Parliament* (1892); *An Imperial Intelligence Union* (1906); *A Memorable National Epoch* (1908); *The Beginning of the Empire* (1910).

FLEMING, WILLIAMINA PATTON (STEVENS) (1857-1911). An American astronomer. She was born at Dundee, Scotland, where she taught school from 1871 to 1876. In 1879 she became an assistant at the Harvard College Observatory, where she was appointed curator of astronomical photographs in 1898 and later took charge of the Astrophotographic Building. On plates exposed in 1897 and 1902 she found the spectrum of a meteor, and she is also known as the discoverer of new stars and variables. In 1906 she became an honorary member of the Royal Astronomical Society, London, and at Wellesley College she was an honorary associate in astronomy. She published *A Photographic Study of Variable Stars* (1907) and *Spectra and Photographic Magnitudes of Stars in Standard Regions* (1911).

FLEMINGS. See TEUTONIC RACE.

FLEMINGSBURG. A city and the county seat of Fleming Co., Ky., 64 miles (direct) southeast of Cincinnati, Ohio, on the Cincinnati, Flemingsburg, and Southeastern Railroad (Map: Kentucky, G 2). It is in an agricultural region, has a trade in tobacco, poultry, and live stock, and manufactures tobacco, flour, lumber, etc. Pop., 1900, 1268; 1910, 1219.

FLEMINGTON. A borough and the county seat of Hunterdon Co., N. J., 52 miles by rail west by south of New York City, on the Lehigh Valley, the Pennsylvania, and the Central of New Jersey railroads (Map: New Jersey, C 2). It is the commercial centre for a productive agricultural region and has manufactures of foundry and machine-shop products, shutters, vinegar, gloves, stoneware, flour, brick, and cut glass. There is a public library. Pop., 1900, 2145; 1910, 2693. As early as 1712 nearly all the land comprising the site of the present borough was owned by three proprietors, William Penn, Daniel Cox, and Joseph Kirkbridge. During the Revolution Flemington was in some degree a centre for military operations, and in 1776 a skirmish took place here in which the British troops were routed.

FLEMISH LANGUAGE AND LITERATURE (Flem. *Vlaemsch*, Dutch *Vlaamsch*, OFris. *Flemsche*, *Flaemsche*; connected with Flem. *Vlaenderen*, Dutch *Vlaanderen*, Ger. *Flandern*, Flanders). The Low German language and literature of Belgium. The earliest history of the Flemish language is also the history of Dutch, the name specifically applied to the language of the Netherlands. The oldest stage of both is the dialect group called Old Low Franconian, spoken, from the seventh century to the middle of the twelfth, by various German peoples in the whole lower Rhine region, from the confluence of the Ruhr with the Rhine to the sea. When out of the popular dialects, in the second half of the twelfth and the beginning of the thirteenth century, a written language was developed, a number of dialect groups existed in what are now the Netherlands and Belgium that had an important bearing upon the subsequent formation of

the language. Frisian (q.v.), at the beginning the principal dialect, was spoken in the territory farthest north and along the seacoast; Saxon, in the region about the Yssel; Franconian, on the Rhine. Out of Frisian and Saxon contact had arisen a Frisian-Saxon mixed dialect, which was spoken principally in territory subsequently Dutch, but also in a small part of West Flanders. Out of Frisian contact with Franconian, furthermore, had arisen a Frisian-Franconian mixed dialect. The territory of the latter, besides those parts subsequently Dutch, was East Flanders, west of the Scheldt and the Lys, and the greater part of West Flanders. Pure Franconian was spoken in territory subsequently Dutch, but also in East Flanders, east of the Lys and the Scheldt, in Antwerp, in South Brabant, and in Limburg. Each of the main dialects, in this way, contributed its quota to what was, in the end, to be the language of the Low German part of Belgium.

The first dialect which, as far as can be ascertained, developed a written language, was the Franconian of Limburg, in which Henrik van Veldeke, born in the neighborhood of Maastricht, wrote after the middle of the twelfth century. The oldest poems of the thirteenth century were written in Limburg, Brabant, Antwerp, and particularly in Flanders. They all exhibit local dialectic peculiarities, but there is visible in them, at the same time, the tendency towards a common literary form. The Flemish poet Jacob van Maerlant (c.1235-1300), the founder of the didactic school of poetry in the Netherlands, and sometimes called "the father of Dutch poets," in his *Leven van St. Franciscus*, names as dialects "Duutsch" by which he apparently means the dialect of Holland, Brabantish, Flemish, and Zealandish. His own work shows the striving, already indicated, to write a literary form, which tendency obviously continued during the succeeding centuries, down to the close of the middle period in the history of the language, at the end of the fifteenth century.

During the sovereignty of the dukes of Burgundy, which terminated in 1477, the language was subjected to French influence, which resulted not only in the introduction of a multitude of French words, but also in the loss of inflectional endings, and made the sixteenth century a period of linguistic confusion. The writers on language, of whom there were many at this time, endeavored each to make his own dialect the recognized literary form, and the dialect of Bruges, the East Flemish of Ghent, and the dialect of Brabant were in turn presented as forms of usage. Towards the end of the century, however, this had given way to the feeling that the common language should have more general characteristics and should represent the whole rather than any particular part. Pontus de Heuter, who published, in 1581, at Antwerp, his *Nederduitse Orthographie*, said of his own language that it is "set together out of the speech of Brabant, Flanders, Holland, Guelders, and Cleves," and this was ultimately the common attitude.

The possibility of the development of a common literary language for the Netherlands and Belgium, which at this time, on account of the superior literary culture of Brabant and Flanders, bade fair to have a southern character, was definitely determined in the negative by the political events at the close of the sixteenth century. The northern provinces, in 1581, for-

mally threw off their allegiance to the Spanish crown and, as the Dutch Republic, declared themselves an independent state. The centre of literary culture was presently shifted from the south to the north, and out of the dialect of the Province of Holland was developed the literary language of the Netherlands, called specifically Dutch.

The southern provinces were destined to a wholly different fate. After the taking of Antwerp, in 1585, by the Duke of Parma, the Belgian Netherlands (including Limburg, South Brabant, Antwerp, East Flanders and West Flanders, etc.) were separated from the northern provinces. They remained under Spanish supremacy until, in 1714, by the Peace of Rastadt, they were awarded to Austria. In 1794 they were conquered and annexed to France. During this whole period of foreign domination literature had sunk almost to its lowest possible ebb. The literary language, which at one time had made its influence felt over the whole of the Low Countries, remained fixed in its sixteenth-century form and was on the point of degenerating again into a mere dialect of the people. Its place as the language of the cultured classes, and particularly after the French occupation in 1794, had been taken more and more by French, already the sole language of the other Belgian provinces, Liège, Luxembourg, Namur, and Hainaut. The union of Belgium with Holland into the Kingdom of the Netherlands, in 1815, did not change existing conditions. Although the new sovereign, William of Orange, did his utmost to further the use of Low German in the place of French, his efforts were opposed both by the people, who from the standpoint of their own dialect regarded the language as a foreign tongue, and by the cultured classes, who would not thus differentiate themselves from the French-speaking provinces of the south. The revolution of 1830, which finally separated Belgium from Holland and in the end made it an independent European state, apparently settled for all time the fate of the Low German language. French became the single official medium; a literary language no longer existed in the Low German provinces, and the spoken dialects, with considerable local differences, alone held possession of the field.

A movement, known as the "Flemish Movement," whose purpose was to rehabilitate Low German as the literary and official language, was, however, begun about 1830 and has ultimately been successfully carried through. Jan Frans Willems (1793-1846), who in the time of the United Kingdom had attempted without result to further the use of the native tongue, now set out, in the light of the awakening of the new spirit of nationality, after 1839, to accomplish this end. Under the influence of this movement poets like Karel Ledeganc (1805-47), Theodor van Rijswijk (1811-49), and Prudens van Duyse (1804-59), and prose writers like Hendrik Conscience wrote Flemish, and an active propaganda was made to bring the language back again into the place in which it once stood in the estimation of all classes of the community. The Belgian government, by the language laws of 1873, 1878, 1888, and 1897, gave to the movement the official sanction which was needed to complete it. By these enactments Flemish is made, with French, the legal and official language of the kingdom, the knowledge of which is required, and it is placed among the

subjects of public instruction in the schools. The foundation of the Royal Flemish Academy (*Koninklijke Vlaamsche Akademie*), in 1886, was the final consummation of the movement.

The territory of the Flemish language at the present time is, generally speaking, the Belgian provinces of Antwerp, Limburg, Brabant, East Flanders, and West Flanders, the boundary between French and Flemish being approximately a straight line drawn from Liège southward of Brussels to Calais, although French is spoken in some places to the north and Flemish to the south of such a line. The Flemish language does not differ materially from Dutch, with which in the earliest period, as we have seen, it was co-incident. The three centuries during which there was little connection between the northern and the southern Netherlands, and in which each went its own way, brought about differences, however, that, in spite of the unity that has been adopted in the orthography of Dutch and Flemish, still make the one readily distinguishable from the other. In addition to peculiarities of syntax, of idiom, and of the specific choice and meaning of words, Flemish is particularly characterized by the relatively large number of French elements in its vocabulary.

Flemish Literature. It is only with the Flemish movement, already mentioned, that the history of Flemish literature, in the strict sense of the word, begins. Before the nineteenth century the literature of Flanders was indistinguishable from Dutch. (See *DUTCH LITERATURE*.) The first real step towards a recognition of Flemish was made by the Academy of Brussels in 1772, which put this language on an equal basis with French and Latin. The movement was checked by the French occupation in 1794, and, as noted above, it was not until Jan Frans Willems appeared that Flemish became a literary language. As early as 1818 Willems set forth his views concerning the value of Flemish and its ancient history in his dissertation, *Sur la langue et la littérature néerlandaises, par rapport aux provinces méridionales des Pays-Bas*. The movement was actively supported by the government until 1830, when it received a temporary setback. Soon, however, the government returned to its policy of encouragement, and in 1836 commissioned Willems to publish the Middle-Flemish poem of *Reinaert de Vos*, which he had discovered. This was followed by other texts in rapid succession. At the same time a Flemish annual, *Nederduitsch letterkundig jaarboekje*, was being published by Rens and was in a flourishing condition. Other pioneers with Willems were David (1801-66), the founder of the review *De Middelaer*, Serrure, Snellaert, Blommaert, who founded the *Nederduitsche letteroefeningen*, an organ for new Flemish writers, and Bormans, of whom the last four collaborated in the *Belgisch Museum*, which was edited by Willems. One of the most important of the early Flemish writers was Karel Lodewijk Ledeganc, whose poetry marks an epoch in the history of the literature, in such contributions as his *Bloemen nijner lente*, and *De Hut in 't Woud*. He became later also a prose writer in his *De Zinnelooze* and *Vaarwel tot de jeugd*; but his masterpiece is the poem *De drie Zustersteden* (1846), in praise of Ghent, Bruges, and Antwerp, the three capitals of Flanders. The Middle Flemish literature, whose study had been begun by Willems, was continued ably by Serrure in his *Vaderlandsch Museum* (1855-61) and by

David, Bormans, and Snellaert. The most important of the early novelists was Hendrik Conscience (1812-83), whose masterpiece was his *Jacob van Artevelde*, published in 1850, but who was a most prolific author, writing no less than 71 books. He aroused national spirit by picturing the valiant struggles of the Flemings against the Spaniards. Theodor van Rijswijk returned to poetry, especially political and satirical, publishing *Oorspronkelijke Verhalen* and *Eppenstein*, and his masterpiece describing the Flemish aspirations, *Antigonus*. Contemporary with Van Rijswijk was Van Beers, the Romantic poet, famous for his *Levensbeelden*, *Gevoel en Leven*, and his long epic *Begga*. Following Conscience came a line of novelists, such as Deleroix, author of *Geld of Liefde* and *Philippine van Vlaanderen*, Sleetckx (1818-1901), who wrote *Volksverhalen*, *In 't Schipperskwartier*, *Op 't eksterlaar*, and *Dirk Meyer*, and Snieders (1812-88), well known for his *De gasthuisnon*. Romanticism found an exponent in Bergmann's *Verspreide schetsen en novellen* (written under the pseudonym of "Tony"). A new generation arose—one which had not to create, but to develop, a movement. Here are prominent the names of Dantzenberg, whose *Volksliederen* were followed by the poems of De Cort and Van Droogenbroeck. The novel, to which Conscience had contributed so copiously, also received fresh inspiration in Madame Courtmans (1811-90), who wrote 58 tales, of which the most important are *Rosa van den Busckant*, *Moeder Danciel*, *Het plan van Heintje Barbier*, *De Koewachter*, and *Het rad der fortuin*. Two poetesses, the sisters Rosalie (1834-75) and Virginie Loveling (b.1836), are important figures in the literature of Flanders; and their novels, such as *Broeder en Zuster*, *M. Damien en zijne erfenamen*, by Rosalie, and *Sidon*, *Emiliaantje*, and *Octavie en Estelle*, by Virginie, are also worthy of note. Of the West Flemish authors the chief is the Abbé Guido Gezelle (1830-99), whose poems preach the piety of the Church militant in his *Dichtoefeningen* and his *Gedichten, Gezangen en Gebeden*. The drama has also been developed by the Flemish, who tend especially, like the Dutch, towards comedy. Especially noteworthy productions in this branch of literature are the *Meester en knecht* and *Zannekin* of Sleetckx, besides a large number of less important plays. Among the newest names in the various literary genres are Hilda Ram, Pol de Mont, Geyter, Cyril Buysse, Streuvels, Saabe, Woestijne, Baekelmans, De Clereq, Roose, and De Potter.

FLEMMING, PAUL. See FLEMING, PAUL.

FLEMMING, PAUL. The chief character in Longfellow's *Hyperion*.

VOL. VIII.—44

FLEMMING, WALTER (1843-1905). A German anatomist. He was born at Sachsenberg, Germany, April 21, 1843. He studied at Göttingen, Tübingen, Berlin, and Rostock. He was privatdocent in the last-named place in 1871 and in Prague in 1872 and after 1876 was professor of anatomy in Kiel. His contributions to the knowledge of the finer structure of the cell, and of the process of mitosis, are very important. He wrote: *Zellsubstanz, Kern und Zelltheilung* (1882); *Beiträge zur Kenntniss der Zellen und ihrer Lebenserscheinungen* (1879-81); *Studien über Regeneration der Gewebe* (1885); *Neue Beiträge* (1887-91).

FLENSBURG, flens'burk. A town in the northern part of the Prussian Province of Schleswig-Holstein, pleasantly situated at the end of the Flensburg Fiord, on the Baltic, about 40 miles northwest of Kiel (Map: Prussia, C 1). The buildings worthy of mention are the Marienkirche, the Nikolaikirche, the courthouse, and the theatre. The Flensburg Lion in the old churchyard dates from 1853 and was erected by the Danes to commemorate their victory. The old cemetery is noteworthy and contains a sphinx by Thorvaldsen. Educational institutions include a gymnasium, an agricultural school, a trade and navigation school, and a training school for marine machinists. The industries include shipbuilding, with large dry-dock facilities, the manufacture of iron and machinery, the production of paper, cloth, carpets, chalk bricks, glass, furniture, tobacco, smoked fish, cement, and vinegar. There are oil and rice mills. The city does a thriving trade in grain, chemicals, coal, lumber, coffee, sugar, horses, and fat cattle. The fisheries are productive. Flensburg is the official town of the circle. Pop., 1900, 48,937; 1910, 60,922. April 1, 1910, the communes Engelsby, Twedt, Twedterholz, were incorporated with the city; a fine monument to Kaiser Wilhelm II, by Haverkamp, was erected in the same year. The town dates from the twelfth century. Queen Margaret, founder of the Union of Kalmar, died here in 1412. Flensburg was captured twice in the Thirty Years' War and has suffered much from military campaigns. Severe battles were fought in its vicinity in the Schleswig-Holstein wars, and it was annexed with Schleswig to Prussia in 1864.

FLERS, flâr. A town in the Department of Orne, France, on the Vere, 41 miles by rail from Alençon (Map: France, N., E 4). It has an old castle, dating from the fifteenth century, a Norman church, a college, a commercial school, a library, museum, and a race track. There are manufactures of linen, fustian, damask table covers, shirtings, ticking, and dyestuffs. Pop. (commune), 1901, 13,680; 1911, 13,610.

FLESCHE, KARL (1873-). A Hungarian violinist. He was born at Moson and studied violin under Grün at the Vienna Conservatory in 1886-89. From 1890 to 1894 he was a pupil of Marsick at the Paris Conservatory. He made his début as a virtuoso in 1895 in Vienna. In 1897 he settled in Bucharest, where he was professor at the conservatory from 1897 to 1902 and leader of the private quartet of the Queen of Rumania. In 1903 he accepted a call from the Conservatory in Amsterdam, where he remained till 1908. The phenomenal success of a series of five historical violin recitals in Berlin in 1909 induced him to settle in that city. Thereafter he devoted his entire time to con-

certizing and teaching privately. Both as a virtuoso and as a teacher he met with singular success. The publication of his famous *Urstudien* for violin (1910) at once placed him in the front rank of teachers. In 1913-14 he made a most successful concert tour of the United States. He also published masterly editions of the violin works of Mozart, Beethoven, Mendelssohn, Paganini, and Kreutzer.

FLESH (AS. *flæsc*, OHG. *fleisk*, Ger. *Fleisch*, flesh, Icel. *flesk*, pork). The ordinary term for the muscular portion of animal tissues. Numerous analyses have been made of the muscular substance of various animals. The following table gives the determinations of the individual constituents of beef freed as far as possible from blood vessels and may be regarded as fairly representing the composition of flesh generally:

CONSTITUENTS	Percentage amounts	
Water.....	From 75.00	to 77.00
Solid constituents.....	25.00	23.00
The solid constituents include:	100.00	100.00
Muscular fibre.....	From 13.00	to 18.00
Gelatinous substance.....	0.60	1.90
Albumen.....	2.20	3.00
Kreatin.....	0.07	0.14
Kreatinin.....	undetermined	
Inosic acid.....		
Fat.....	From 0.50	3.00
Lactic acid.....	0.60	0.68
Phosphoric acid.....	0.66	0.70
Potash.....	0.50	0.54
Soda.....	0.07	0.09
Chloride of sodium.....	0.04	0.09
Lime.....	0.02	0.03
Magnesia.....	0.04	0.08

This list, however, does not include all the ingredients of flesh. In the freshly expressed muscular juice, which exhibits a strong acid reaction, we also find small quantities of proteids (myosin, muscle albumen, and hæmoglobin), acids (sarcolactic acid and acid phosphates), salts of potassium and sodium, mineral substances (phosphoric acid and potash), and extractives (either basic substances or amides, as kreatin, xanthin, carnin, and carnic acid—all representing the fragments of broken-down proteids and of no use as tissue builders). There are also found hypoxanthin and formic, butyric, and acetic acids (which may all be products of decomposition), uric acid, urea, and inosit (q.v.). Bernard discovered glycogen (q.v.) in the muscles of the embryos of various animals.

The dried flesh of the ox is practically identical in its ultimate composition with dried blood, as is shown by the following analyses, which were made by Playfair:

CHEMICAL COMPONENTS	Beef	Ox blood
Carbon.....	51.83%	51.95%
Hydrogen.....	7.57	7.17
Nitrogen.....	15.01	15.07
Oxygen.....	21.37	21.39
Ash.....	4.23	4.42

For further information on the subject, consult: Liebig, *Researches on the Chemistry of Food*, trans. by Gregory (Edinburgh, 1847); Hutchison, *Food and the Principles of Dietetics* (London, 1911); Blyth, *Foods: Their Com-*

position and Analysis (ib., 1909); Cocroft, *Foods, Nutrition and Digestion* (Chicago, 1912). See also bibliography under CHEMISTRY, PHYSIOLOGICAL.

FLESH BIRD, or **MEAT BIRD**. A name given in various parts of the world to birds that come about camps or ships and devour fragments of meat. In North America it refers to the Canada jay. See JAY.

FLESH FLY, **BLOWFLY**, or **MEAT FLY**. Any of several large, noisy, blue or green flies of the house-fly type, which lay their eggs on exposed wounds, meat, or carrion. A very conspicuous one is a large bluebottle fly (*Calliphora erythrocephala*), rather dull in color, with a rust-red forehead and black spines on the thorax. It is the common blowfly of Europe, whose maggots are called "gentles" and are used as bait by English anglers. Another familiar British species (*Sarcophaga carnaria*) is rarely seen in America, where its place is taken by a similar scavenger species (*Sarcophaga sarracenia*). A third well-known American species is the greenbottle (*Lucilia caesar*), which often enters houses. This and the preceding species frequently lay their eggs in the putrid mass of insects caught by the plants of the flytrap (*Sarracenia*). In the Western States a most troublesome kind is the screw-worm fly (*Comptosia macellaria*), which ranges throughout the warmer regions of both Americas and sometimes attacks wounds or diseased parts (as the nostrils) of men as well as domestic animals. Indeed, the evil effects of several sorts of flesh flies (including the small gray ones of the genus *Helicobia*) are referred to in medicine by the term "miasis." The stable fly (*Stomoxys calcitrans*) should also be mentioned here.

The breeding habits and life history of all these flies are essentially similar. The eggs are laid in packets on dead animals or upon raw or even cooked meat, each packet containing from 3 to 100 eggs. The instincts which guide the fly to just the food its larvæ will require are as precise as they are curious. Prof. Jacques Loeb records, in his *Physiology of the Brain* (New York, 1900), that where pieces of lean meat and of fat from the same animal were exposed together "the fly never failed to lay its eggs on the meat and not on the fat"; furthermore, he was unable to rear the larvæ on the fat. He believes the attraction and choice are due to chemitropism in the parent fly. The larva issues in from 20 to 24 hours, and buries itself in the carrion, feeding continuously for two weeks, when it crawls aside into some protected place and transforms to pupa, in which stage it remains from two days to several weeks. There are several generations each year, and the part which these insects play in the rapid removal of decaying carrion is very important. Unfortunately these insects also attack the fresh wounds of living animals with most injurious effects; and Packard states, in regard to *Calliphora vomitoria*, that it grievously tormented wounded soldiers on the battlefield during the American Civil War. Careful cleaning of infected wounds of animals with dilute carbolic acid, and covering them with a dressing of tar, are remedial measures. Consult Osborn, "Insects Affecting Domestic Animals," in *United States Department of Agriculture, Division of Entomology, Bulletin 5* (Washington, 1896). See FLY; Tsetse Fly.

FLESSELLES, fle-sél', JACQUES DE (1721-89). A French official in the earliest days of the Revolution. He was master of requests and then became supervisor at Moulins (1762) and in Brittany (1765), where he sided with D'Aiguillon and De Saint-Florentin against Parliament and La Chalotais (q.v.). He showed himself a clever officer at Lyons, where he went in 1767, and became popular for his unwilling acquiescence in the policy of Turgot and later for his administration of the government in the "paternal" mode. He became Councilor of State in 1784 and was one of those blamed for the Pact of Famine, by which the people thought the government had combined with the grain merchants to raise the price of breadstuffs. In 1789 he was made provost of merchants of Paris—the last to hold this office, which was followed by the mayoralty (*mairie*). On July 13 he tried to organize a civic guard. On the 14th, after the taking of the Bastille, a note found on De Launay seemed to prove that he had attempted to deceive the people. The mob started with him to the Palais Royal, but he was shot on the way, his body horribly mutilated, and the head carried on a pike through the streets.

FLETA. The title of an ancient English law book, popularly attributed to one of the learned judges of the time of Edward III, but of wholly unknown authorship. Its title is supposed to be derived from the fact of its having been written in the Fleet Prison. It is one of a numerous class of legal textbooks, founded upon the great work of Bracton (q.v.), which appeared towards the close of the fourteenth century. It never had any considerable authority and is inferior in arrangement as well as in originality to the treatise attributed to Britton (q.v.), which was written at about the same time and with which it is often compared. Consult J. Sheldon's *Dissertation on Fleta*, R. Kelham, translator (London, 1771).

FLETCHER, ALICE CUNNINGHAM (1845-). An American ethnologist and worker for the betterment of the American Indians. She was born in Boston, Mass. In 1891 she was awarded the Thaw fellowship in the Peabody Museum of Harvard University, and as vice president of the American Association for the Advancement of Science (1896), president of the Anthropological Society of Washington, president of the American Folk-Lore Society and of the Archaeological Institute of America (1879), she became widely known in American scientific circles. As a worker for the American Indians, she originated the plan whereby small loans they are encouraged to buy land and build houses. In 1883-84 she served as United States special agent to allot the Omaha tribes their lands in severalty, and in 1887 she acted in the same capacity for the Winnebago and Nez Percé tribes. Tact, sympathy, and a just appreciation of the Indians enabled her to discharge all these missions successfully, and incidentally endeared her to the tribes for whom she worked. In 1893 Miss Fletcher was one of the judges in the anthropological department of the World's Columbian Exposition, and she was also appointed a member of the advisory board in the department of anthropology in the University of California. Her publications include monographs upon American ethnological subjects, such as *Indian Ceremonies* (1884) and *A Study of Omaha Indian Music* (1893), pub-

lished by the Peabody Museum; *The Import of the Totem* (1897), published by the Smithsonian Institution; other monographs published by the United States Bureau of Ethnology; various articles in the *Anthropologist*, the *Folk-Lore Journal*, and *Science*; a *Report on Indian Civilization and Education*, published by the United States Senate; and *Indian Story and Song from North America* (1900), a unique collection of native music gathered from the Omaha, Pawnee, and other Western tribes, and accompanied by translations and explanatory texts, which has already borne fruit by suggesting American compositions.

FLETCHER, ANDREW (1655-1716). A Scottish patriot and publicist. He was born in Saltoun, East Lothian. His father, Sir Robert Fletcher, dying when his son was 10 years of age, committed him to the care of Gilbert Burnet, who superintended his education for five years. In 1681 he sat in Parliament as commissioner for East Lothian. Prior to this he had strongly opposed Lauderdale's policy and now offered a determined opposition to the test oath and to the Duke of York's oppressive measures. He was obliged to flee to Belgium; but fearing arrest by Spanish agents, he secretly returned to England, and after the Rye House Plot, in which he had counseled moderation, he joined the Duke of Monmouth in Holland. He landed with Monmouth's expedition at Lyme, Dorsetshire, but in a quarrel about a horse shot a local ex-alderman, a fellow campaigner, and fled to Spain for safety. The authorities imprisoned him when he landed; but he made a romantic escape and, after traveling in disguise through Spain, reached Hungary, where he fought as a volunteer against the Turks. He joined William of Orange at The Hague in 1688 and in the Revolution returned to Scotland. His policy was now to create a Scottish Home Rule party. After the Union he retired from public life and devoted himself to agriculture. Among his improvements was the introduction of winnowing fanners and of pot barley into Scotland. His polemical tracts, which appeared anonymously, were collected and published after his death. Consult: Fletcher, *Political Works* (London, 1732); Erskine, *Essays on the Lives and Writings of Fletcher of Saltoun and the Poet Thomson* (ib., 1792); Omond, *Fletcher of Saltoun* (New York, 1897); Burnet, *History of his own Time* (6 vols., Oxford, 1833); Dalrymple, *Memoirs of Great Britain and Ireland* (London, 1873); Wodrow, *History of the Sufferings of the Church of Scotland* (Edinburgh, 1842).

FLETCHER, BANISTER FLIGHT (1866-). An English architect, educated at University College, London, and at the Royal Academy. In 1888 he won the Architectural Association medal for design and in 1895 the Tite medal for architectural design. He was London University extension lecturer on architecture, vice president of the Architectural Association, and a partner, with his brother Herbert Phillips Fletcher (b. 1872), in the firm of Banister Fletcher and Sons, founded by his father, Prof. Banister Fletcher (1833-99), who wrote a well-known book on *Model Houses for the Industrial Classes* (1871). This firm built the King's College School, London, and had charge of additions and alterations on the Carpenters' Hall, London Wall, etc. B. F. Fletcher traveled widely, especially on architectural sketching

tours, and wrote *A History of Architecture on the Comparative Method*, with his father (1896); with H. P. Fletcher, *Architectural Hygiene* (1899) and *Carpentry and Joinery* (4th ed., rev. and enlarged, 1914); *Andrea Palladio* (1902); *Architecture and the Humanities*.

FLETCHER, BENJAMIN. Colonial Governor of New York from 1692 to 1698. The date and place of his birth and the date of his death are not recorded. By profession a soldier, he served in the Low Countries and in Ireland, and in 1692 was appointed Governor of New York by William and Mary and also commander of the Connecticut military forces. In the same year he was directed to take over the administration of Pennsylvania and the territories on the Delaware, William Penn having been temporarily deprived of his proprietary rights. He was strongly opposed by the Leisler faction in New York and in religion by the Independents, who accused him of accepting bribes, interfering with elections, and encouraging piracy; he also quarreled with the Assembly over the right to appoint ministers in the province and over the granting of money. In 1698 he was replaced by Bellomont. For an account of his administration, consult Wilson, *Memorial History of the City of New York*, vol i (New York, 1892).

FLETCHER, DUNCAN UPSHAW (1859-). An American legislator. He was born in Sumter Co., Ga., and was educated at Vanderbilt University (B.S., 1880). Admitted to the bar in 1881, he took up law practice at Jacksonville, Fla., but after 1893 he was most of the time in active political service—as member of the Florida House of Representatives (1893), mayor of Jacksonville (1893-95, 1901-03), chairman of the Democratic State Committee (1905-08), and United States Senator (1909-15). He became a trustee of John B. Stetson University, Deland, Fla., and identified himself with various other institutions.

FLETCHER, FRANK FRIDAY (1855-). An American naval officer, born at Oskaloosa, Iowa. After graduating from the United States Naval Academy in 1875, he passed through the different grades, becoming captain in 1903 and rear admiral in 1911. At various times he commanded the torpedo boat *Cushing*, the gunboats *Kanawha* and *Eagle*, the cruiser *Raleigh*, and the battleship *Vermont*. In 1910 he became aid to the Secretary of the Navy for the division of materials; in 1911 he was placed in command of the Fourth Division of the Atlantic fleet and later in command of the Third Division. He had charge of the naval forces which took possession of Vera Cruz, Mexico, in April, 1914—the first act of hostility on the part of the United States against Huerta. In June, 1914, he was selected to succeed Rear Admiral Badger as commander in chief of the North Atlantic fleet. He was also the inventor of the Fletcher gun mounts and breech mechanism.

FLETCHER, GILES and **PHINEAS**. English poets, cousins of John Fletcher (q.v.) the dramatist, and sons of Giles Fletcher, Queen Elizabeth's Ambassador to the court of Russia.—**GILES** (c.1588-1623), the younger of the two brothers, was educated at Cambridge and died at his living at Alderton, Suffolk. His chief poetical work is a sacred poem, entitled *Christ's Victorie and Triumph*, written and published at Cambridge (1610). It contains scattered passages of fine quality.—**PHINEAS** (1582-1650)

was educated at Eton and Cambridge and became rector of Hilgay, in Norfolk, in 1621, where he died. His most important poem is the *Purple Island: or, the Isle of Man* (1633). It contains an elaborate description of the human body and mind, the former being given with great anatomical minuteness. The mind is represented as being beleaguered by the vices and likely to be subdued, when an angel comes to its aid. Although the poem is formal and pedantic in design, the thought and movement are at times majestic. The Fletchers are known as Spenserians, because they imitated to an extent the stanza and the theme of the *Faerie Queene*. On the other hand, they look forward to Milton, who read them carefully. Their works were edited by A. B. Grosart for the *Fuller Worthies Library* (1868). The Cambridge English Classics edition, *Poetical Works* (Cambridge, 1908-09), ed. by F. S. Boas, is excellent.

FLETCHER, HORACE (1849-). An American author, lecturer, and food expert, born at Lawrence, Mass., and educated at Dartmouth College. He traveled widely and engaged in many lines of work, but after 1895 he paid particular attention to problems of sociology and to researches in human nutrition. His theories of the mastication of food gave rise to the cult of Fletcherism for which he is generally known. He lectured on vital economics in several institutions and became consulting editor of the *Christian Endeavor World*, the *Ladies' Home Journal*, and the *Good Health Magazine*. He was elected vice president of the Food Reform Society of England and president of the Health and Efficiency League of America. His writings include: *A B C of Snap Shooting* (1880); *Menticulture* (1895; 2d ed., 1903); *Happiness as Found in Forethought Minus Fearthought* (1897); *That Last Waif* (1898); *What Sense?* (1898); *Glutton or Epicure* (1899; 2d ed., 1903); *A B-Z our own Nutrition* (1903); *Optimism* (1908); *Fletcherism, or How I Became Young at Sixty* (1913).

FLETCHER, JAMES (1852-1908). A Canadian botanist, born near Wrotham, Kent, England. He was educated at King's School, Rochester, England. In 1874 he went to Canada, where he was Dominion entomologist to the Department of Agriculture until 1887, when he became entomologist and botanist of the Dominion Experimental Farm at Ottawa. In the same year he became editor of the *Canadian Entomologist*. In 1886 he was elected a member of the Linnean Society of London. In Canada he came to be known as "the farmer's friend" because of his successful work in devising methods of exterminating harmful insects. He published a "Flora Ottawaensis" in the *Transactions of the Ottawa Field Club*, vols. i-v (1880-84), continued in the *Ottawa Naturalist*, vols. ii-vii (1888 et seq.).

FLETCHER, JOHN. See under **BEAUMONT, FRANCIS**.

FLETCHER, or DE LA FLECHERE, JOHN WILLIAM (1729-85). An English clergyman and early supporter of Wesleyanism. He was born at Nyon, Vaud, Switzerland, and was educated at Geneva, where he distinguished himself in philology and philosophy. He afterward served as a captain in the Portuguese army, was tutor in an English family, and, although he had already shown his approval of the Wesleyan revival, in 1757 he took orders in

the Church of England. After 1760 he was vicar of Madely, except that in 1768-71 he served as superintendent of the theological college founded by the Countess of Huntington at Trevecca, Wales. He was one of the staunchest supporters of John Wesley, who is said to have approved of Fletcher as his successor; but Wesley lived the longer. Fletcher's *Checks to Antinomianism* (5 vols., 1771) was the most important contribution to the Arminian side of the Calvinistic and Antinomian controversies. His *Appeal to Matter of Fact and Common Sense*, also noteworthy, had many editions. Unlike some of his contemporary controversialists, Fletcher never descended to vituperation; in fact, he was noted for his saintly character. The most important life is that by Luke Tyerman, entitled *Wesley's Designated Successor* (London, 1882). Others are by Wesley (ib., 1786), J. Benson (4th ed., ib., 1817), and J. Marrat (ib., 1902).

FLETCHER, JULIA CONSTANCE ("George Fleming") (1858-). An American dramatic author and novelist. She was born in Brazil, the daughter of a missionary, and, after being educated in the United States and Europe, made her home in Rome. Among her works are: *The Head of Medusa* (1880); *Vestiga* (1884); *Andromeda* (1885); *For Plain Women Only: Dissertations on Feminine Interests* (1896). Her dramatic works include: *A Man and his Wife* (1897); *The Canary* (1899); *The Fantastics* (1900); *The Light that Failed*, a version of Kipling's story (1903); *The Conquest*, from the French (1909); *The First Gentleman in Europe*, with Mrs. Frances Hodgson Burnett (1897).

FLETCHER, PHINEAS. See FLETCHER, GILES AND PHINEAS.

FLETCHER, RICHARD (c.1543-96). An English bishop, a courtier of Elizabeth. He was educated at Corpus Christi College, Cambridge, was prebend of Islington in 1572, married Elizabeth Holland in the following year, and in 1574 was minister at Rye and was presented to Elizabeth by Archbishop Parker. He was a good preacher and did so well in his attempts to please the Queen that he was made vicar of Bradenham (1575), court chaplain (1581), dean of Peterborough (1583), and prebendary of Stow Longa at Lincoln Cathedral, and rector of Barnack and of Algakirk (1586). He preached before Mary Stuart's judges and distinguished himself as chaplain at her execution by his bid for Elizabeth's favor. In 1589 he was made Bishop of Windsor, but lived most of his time at court. In 1592 his wife died. In the same year he was made Bishop of Worcester, and two years afterward became Bishop elect of London. But the Calvinism of the Lambeth Articles, which he helped frame, and still more his second marriage with a widow of small reputation, angered the Queen; he was forbidden to come to court and was suspended from office (1595). He left eight children, one the famous dramatist, John Fletcher.

FLETCHER, ROBERT (1823-1912). An American surgeon and anthropologist, born in Bristol, England. He graduated at the Royal College of Surgeons, England, in 1844, became surgeon of the First Ohio Infantry in 1861, surgeon of United States volunteers in 1863, and subsequently principal assistant librarian in the library of the Surgeon-General's office, Washington, D. C. He also served as lecturer (1884-

86) and professor (1886-88) of medical jurisprudence in Columbian (later George Washington) University, and was president of the Anthropological Society of Washington. In 1910 he was awarded the gold medal of the Royal College of Surgeons, England. He wrote: *Paul Broca and the French School of Anthropology* (1882); *Human Proportion in Art and Anthropometry* (1883); *The New School of Criminal Anthropology* (1891); *Scopelism* (1897); *A Tragedy of the Great Plague of Milan in 1630* (1898); and he edited *Index Medicus*.

FLETCHER, WILLIAM ISAAC (1844-). An American librarian, born at Burlington, Vt., and educated in the public schools of Winchester, Mass. From 1883 to 1911 he was librarian of Amherst College, where he also taught library economy in the summer school for 14 years (1891-1905). In 1891-92 he served as president of the American Library Association. He was coeditor of *Poole's Index to Periodical Literature* (1882-1911), and editor of the *Coöperative Index to Periodicals* (1883-1911) and of the *American Library Association Index to General Literature* (1893, 1901). He also published *Public Libraries in America* (1895).

FLETT, flet, JOHN SMITH (1869-). A British geologist, born in Kirkwall, Orkney, and educated at Edinburgh University, where he became lecturer in petrology and assistant to Prof. James Geikie. He joined the British Geological Survey in 1900 and became petrographer to the Survey in 1902 and assistant to the director in charge of the survey of Scotland in 1911. He wrote many memoirs of the Survey; a *Report* (1902) for the Royal Society on the volcanic eruptions of the Soufrière in St. Vincent, which he studied with Dr. Tempest Anderson, and which they styled the "Peléan type"; and many technical papers, particularly on petrography.

FLEUR-DE-LIS, flêr-dê-lê' (Fr., flower of the lily). Possibly a conventionalized form of the iris plant. As a motive in ornament, it goes back to the days of the Etruscans or earlier. It became the emblem of the kings of France after 1180. Many fanciful explanations are given to account for its adoption, but none has any authority. In 1376 Charles V fixed the form of the French king's coat of arms definitely, *Azure, à trois fleurs-de-lis d'Or*, i.e., three golden fleurs-de-lis on a blue field. See IRIS.

FLEUR D'ÉPINE, flêr dâ'pên', HISTOIRE DE (Fr., History of Thorn Flower). A "conte," or highly romantic tale, written by Anthony Hamilton in the early part of the eighteenth century.

FLEUR ET BLANCHEFLEUR, flêr â blâns'h'flêr'. See FLORE ET BLANCHEFLEUR.

FLEURIAIS, flêr-ê-â', GEORGES ERNEST (1840-95). A French naval officer, born in Paris. After graduation from the Ecole Navale in 1857, he entered the French navy, and rose to be *capitaine de vaisseau* in 1883 and rear admiral in 1892. He served in Mexico in the forces fighting for Maximilian and during the Franco-Prussian War was successively aid-de-camp to Admiral Bonet-Willaumetz, commanding the North Sea squadron, and a soldier in the Army of the Loire. During the war against China, in 1884-85, he commanded the armored cruiser *La Galissonnière*. He was at various times intrusted with important scientific missions, such as the determination of certain meridians by lunar observations (1867-70), and the observation of

the transit of Mercury at Payta, Peru (1878). He received, in 1874 and 1882, the Prix Lalande and the Prix Pluney respectively, for improvements made by him in instruments of navigation, and is best known for perfecting the gyroscopic horizon.

FLEURIEU, flêrê-û', CHARLES PIERRE CLARET COMTE DE (1738-1810). A French naval officer, born in Lyons. He entered the French navy in 1751; in 1768-69 was commander of the *Isis* in an expedition sent out for the trial of the chronometer, or marine watch, in whose invention he had assisted Berthoud, and in 1776 became inspector general of navy yards and ports, so that his was the general supervision of the French navy during the War for American Independence. In 1790-91 he was Minister of the Navy, in 1800 was appointed by Napoleon to the Council of State, and later became successively senator (1805), admiral (1806), and Governor of the Tuileries (1808). He was Minister Plenipotentiary for the signing of the treaty by whose terms Louisiana was ceded to the United States. He published *Voyage fait par ordre du roi pour éprouver les horloges marines* (2 vols., 1773) and *Découverte des Français en 1768 et 1769 dans le sud-est de la Nouvelle-Guinée* (1790).

FLEURUS, flêrûs'. A small town of Belgium, in the Province of Hainaut, situated near the left bank of the Sambre, and 15 miles west of Namur. Fleurus has been the scene of at least four important battles. Here, on Aug. 29, 1622, the German Protestant army, under the Duke of Brunswick and Count Mansfeld, repulsed the Spaniards under Cordova. On July 1, 1690, the French under Marshal Luxembourg defeated a coalition of Spanish, Dutch, and Germans. On June 26, 1794, the French under Jourdan, after an obstinate and bloody conflict at Fleurus, forced 80,000 of the Austrians and their allies, under the Prince of Saxe-Coburg, to retreat from the Sambre and to evacuate Flanders, thereby saving France from invasion. On June 16, 1815, Napoleon defeated the Prussians near Fleurus, though the battle is better known as the battle of Ligny (q.v.). Pop., 1911, 6600.

FLEURY, flêrî (from Fr. *flouré*, flowered, from *flour*, flower, from Lat. *flos*, flower). A term in heraldry signifying that an object is adorned with fleurs-de-lis or parts of the fleur-de-lis; written also, flory, flowry, fleurette, etc. A cross fleury is a cross the ends of which are in the form of the fleurs-de-lis and is distinguished from a cross patonce in that the limbs in the latter are in the form of the segments of a circle and terminate in a mere bud, whereas the cross fleury has the limbs straight and the ends distinctly floriated. See HERALDRY.

FLEURY, flêrê', ANDRÉ HERCULE DE (1653-1743). A French cardinal bishop and chief Minister during the early part of the reign of Louis XV. He was born June 26, 1653, at Lodève in Languedoc, and after an excellent education at Paris entered the Church and became a canon at Montpellier. In 1679 he was called to be almoner to Marie-Thérèse, wife of Louis XIV, and here laid the foundation of his immense fortune. After her death he became royal almoner (1683) and received many preferments, including the abbey of Rivour and the bishopric of Fréjus. In 1715, in accordance with the dying wish of Louis XIV, Fleury became tutor to the young Louis XV, then only five years old, over whom he succeeded in estab-

lishing a complete ascendancy. When the King reached his majority, Fleury was made a member of the Council of State, although he refused to accept the ministry. Nevertheless he wielded enormous power indirectly. His ecclesiastical policy was inimical to the Jansenists. The Duc de Bourbon attempted to struggle against his influence, but only succeeded in bringing about his own dismissal in 1726. Fleury thereupon became virtually Prime Minister, though he did not assume that title, and contented himself with the dignity of Cardinal, which he received in the same year. By strict economy and a wise internal policy Fleury raised France from a state of commercial depression. He effected great reductions in expenses and developed commerce and agriculture without increasing taxation, though he did revive some of the unpopular peasant taxes. Methods of communication developed to an extraordinary extent during his administration. His religious policy tended greatly to increase the power of the Jesuits and to convert the Jansenists into a political party. But he was unfortunate on the whole in his external policy, which embraced the play of politics attendant upon the Polish and Austrian wars of succession. The last of these wars he did not live to see terminated, for he died while still in office, in 1743, at the age of 90. One of the most praiseworthy acts of his administration was the completion of the Bibliothèque Nationale at Paris. He was a scholarly man himself and a member of the various French academies. Consult: Lacretelle, *Histoire du dix-huitième siècle* (Paris, 1830); Verlaque, *Histoire du cardinal Fleury* (ib., 1879); Perkins, *France under the Regency* (Boston, 1892).

FLEURY, CLAUDE (1640-1723). A French church historian, born in Paris. He was educated by the Jesuits and at first practiced law (1658-67), but, preferring an ecclesiastical career, took priest's orders and became tutor to the young princes of Conti (1672) and later (1680) to the Comte de Vermandois, natural son of Louis XIV. After the death of the Count, the King appointed him, in 1684, abbot of the Cistercian Monastery of Loc-Dieu and in 1689 tutor to the royal grandchildren, the dukes of Burgundy, Anjou, and Berri. In 1696 he was elected to the Academy and in 1706 became prior of Argenteuil. The Duke of Orleans appointed him confessor to the young King, Louis XV, in 1716, and he held this office till compelled to resign by the infirmities of age in 1722. Fleury was a man of much learning, kind-hearted and simple in manners, and upright in conduct. Of his numerous works may be mentioned: *Les mœurs des Israélites* (1681); *Les mœurs des Chrétiens* (1682); *Traité du choix et de la méthode des études* (1675); *Institution du droit ecclésiastique* (1687); and, most important of all, the *Histoire ecclésiastique* (20 vols., 1691-1720). This work was the labor of 30 years and is marked by learning and a judiciously critical spirit. J. H. Newman prepared an English translation of the part from the Second Ecumenical Council (Oxford, 1842-44). Fleury's part extends only to 1414, but his continuators have brought it to 1546 in the Paris edition of 1836-37. In the Latin translation (Augsburg, 1758-94) it is continued to 1768. The so-called *Abrégé de l'histoire ecclésiastique de Fleury* (Bern, 1766) has a preface by Frederick the Great. He was a staunch Gallikan, and his posthumous work, *Discours sur les*

libertés de l'église gallicane (1724), has been very popular. His *Complete Historical Catechism*, continued to Pius IX, appeared in London (1871). For his biography, consult the Paris edition of his works (1837), and Hefele, *Der Kirchenhistoriker Fleury* (Tübingen, 1864).

FLEURY, EMILE FÉLIX, COMTE (1815-84). A French general, born in Paris. He became a volunteer in the Spahis in Algeria in 1837, fought bravely, and became captain in 1844. He took an active part in the coup d'état of 1851. In the following year he organized the regiment of the *Guides*, of which he became commander. In 1856 he was promoted to the rank of brigadier general, became chief aid-de-camp to the Emperor, and, in 1865, senator. In 1866 he was sent as Ambassador to Florence and in 1869 as Ambassador to Russia, where he attempted to get aid against Germany. In 1870, when the Empire fell, he retired. He wrote *Souvenirs, 1837-67* (2 vols., 1897-98), largely a defense of the policies of Napoleon III, and *La France et la Russie* (1902).

FLEURY, FRANÇOIS LOUIS TEISSEIDRE, MARQUIS DE (1749-94). A French soldier, who served in the American army during part of the Revolutionary War. He was born at Saint-Hyppolite in Languedoc, served in Corsica in 1768 and 1769, and in 1776 came to America for service in the Patriot army. He became a captain of engineers in May, 1777; had a horse killed under him at Brandywine; with John Laurens tried to fire the Chew House at Germantown; was appointed brigade major to Pulaski in October, 1777; in November was wounded at Fort Mifflin (q.v.), where he was engineer in chief; was promoted to be lieutenant colonel in the same month; was second in command of a picked corps of 600 men in the battle of Monmouth; served under Sullivan in Rhode Island, and at the beginning of the campaign of 1779 was placed in command of a regiment of light cavalry. In July, 1779, the Continental Congress voted him a silver medal for his gallantry at Stony Point, where he led the right column, was the first person to enter the fort, and tore away the British flag with his own hands. Late in 1779 he returned to France, but subsequently took part in the siege and capture of Yorktown. In December, 1781, he received the rank of Chevalier of St. Louis, and he ultimately attained the rank of *maréchal de camp* in the French army, having served in Pondicherry. There is a good brief sketch in Balch, *The French in America*, pp. 125-128 (Philadelphia, 1895).

FLEURY, JEAN FRANÇOIS BONAVENTURE (1816-94). A French teacher and author, born at Vasteville. He was educated at Cherbourg as bursar, then became a journalist, but after the coup d'état of December 2 he devoted himself to teaching. In 1858 he went to Russia as a private tutor and later was in public education. In 1872 he became professor at the St. Petersburg School of Law, and a little afterward reader in French in the university. He returned to France about 1890. Among his works mention should be made of the following: *Vie de Bernardin de Saint Pierre* (1843); *Krylov et ses fables* (1862); *La grammaire en action* (1864); *Essai sur le patois normand de Hague* (1866); *Histoire élémentaire de la littérature française* (2 vols., 1867; 22d ed., 1903); *Rabelais et ses œuvres* (2 vols., 1877); *Marivaux et le Marivaudage* (1881); *Littérature populaire*

de la Basse Normandie (1883). Fleury's daughter is the novelist known as Henry Gréville.

FLEURY, MAURICE DE (1860-). A French physician, born at Bordeaux and educated in the University there. He was on the staffs of the hospitals of Bordeaux and later at Paris. He specialized in nervous complaints. His writings include: *Contribution à l'étude de l'hystérie senile*, a doctoral thesis (1890); *Traitement rationnel de la neurasthénie* (1894); *Pathogénie de l'épuisement nerveux* (1896); *Introduction à la médecine de l'esprit* (1897); *L'Âme du criminel* (1899); *Le corps et l'âme de l'enfant* (1899); *Manuel pour l'étude des maladies du système nerveux* (1904); *Nos enfants au Collège* (1905); *Bréviaire de l'arthritique* (1912).

FLEURY DE CHABOULON, de châ'bōŭlōn', PIERRE ALEXANDRE EDOUARD, BARON (1779-1835). A French legislator and secretary of Napoleon I. He was scarcely 16 when he became commander of a battalion of the National Guard. After serving in the Ministry of Finance and as an auditor of the Council of State, he was subprefect of the Department of the Meurthe. His services attracted the attention of Napoleon, who in 1814 appointed him auditor at army headquarters and subsequently sent him as prefect to Reims, which he placed in a state of defense against the allied armies. Upon the return of Napoleon from Elba he became his private secretary. Banished after the Emperor's final deposition, he went to London, where he wrote his celebrated *Mémoires pour servir à l'histoire du retour et du règne de Napoléon en 1815* (2 vols., 1819, new ed., 1901; Eng. trans., 1820; Ger. trans., by Bergk, 1821). He returned to France, became Councilor of State under the July Government (1830), and also a deputy in 1834.

FLEURY-HUSSON, ū'sōn', JULES. See CHAMPFLEURY.

FLEX'NER, ABRAHAM (1866-). An American educator, born at Louisville, Ky., brother of Simon Flexner. He was educated at Johns Hopkins (A.B., 1886), Harvard (A.M., 1906), and Berlin universities. After many years of educational work, beginning in 1886 as a teacher in the Louisville High School, he was from 1908 to 1912 expert to the Carnegie Foundation for the Advancement of Teaching, and then became assistant secretary of the General Education Board. He became a fellow of the American Association for the Advancement of Science. Besides contributions to the educational press, he is author of *The American College* (1909); *Medical Education in the United States and Canada* (1910); *Medical Education in Europe* (1912); *Prostitution in Europe* (1914).

FLEXNER, SIMON (1863-). A distinguished American pathologist and bacteriologist, born at Louisville, Ky., brother of Abraham Flexner. He graduated from the University of Louisville (M.D., 1889) and also studied at Johns Hopkins, Strassburg, and Berlin universities. From 1891 to 1899 he was associate professor and professor of pathological anatomy at Johns Hopkins and from 1899 to 1904 professor of pathology at the University of Pennsylvania. In 1900 he was also pathologist to the University and Philadelphia hospitals and in 1901 director of the Ayer Clinical Laboratory of the Pennsylvania Hospital. He took charge in 1903 of the laboratories of the Rockefeller Institute

for Medical Research, New York, where he did much important work—he announced in 1913 that he had discovered the germ of infantile paralysis. He is author of papers on the bubonic plague, bacillary dysentery, cerebrospinal meningitis, snake venom, infectious diseases, and various other subjects. Both Harvard and Yale conferred upon him the honorary degree of D.Sc., and in 1914 he was decorated with the cross of Chevalier of the Legion of Honor. In 1914 he was president of the Association of American Physicians.

FLEX'URE (from Lat. *flexura*, curve, from *flectere*, to bend). This term denotes the bending of loaded beams. If a beam, supported at its two ends, be loaded, it bends, its lower surface becoming convex and its upper concave. In this bending the fibres in the lower surface are stretched, and those in the upper are compressed, while between these surfaces there is one called the "neutral" surface, wherein the fibres are neither stretched nor compressed. Experiments show that the flexure of solid beams supported at their ends and loaded varies (1) directly as the load, (2) inversely as the product of their *breadths* and the cube of their *depths*, and (3) directly as the cube of the distance between the supports. Since flexure is primarily a phenomenon of stretching and compression, the coefficient of elasticity involved is Young's modulus. See ELASTICITY; STRENGTH OF MATERIALS.

FLICK'EL, PAUL (1852-1903). A German landscape painter, born in Berlin, pupil of Theodor Hagen at the School of Art in Weimar. He worked independently at Düsseldorf and from 1876 in his native city. His views of Italy, which he visited in 1877, depicting especially the luxuriance of southern vegetation, and all his landscapes, for which later he selected scenery near the coast of the Baltic and in the Harz Mountains, are remarkable for beautiful sunlight effects. A "Beech-Wood Near Prerow" was awarded the great gold medal at Berlin in 1886 and is now in the National Gallery, Berlin. Among others may be noted "The Ilse Valley in the Harz" (1888), "Sylvan Solitude" (1892).

FLICK'ER (onomatopoetic, from the bird's note). The popular name of one of the commonest and handsomest birds in the eastern United States, the golden-winged woodpecker (*Colaptes auratus luteus*). It is a little more than a foot in length, and the bill, which is $1\frac{1}{2}$ inches long, is slender and somewhat curved, very unlike the ordinary woodpecker's bill. The back is olive brown, barred with black, while the rump and upper tail coverts are pure white; the top of the head and the sides of the neck are ash, with a bright scarlet nuchal band; the under parts are lilac brown anteriorly, fading into creamy yellow posteriorly, marked with numerous circular black spots; a broad, black crescent crosses the breast; the wings and tail are on the underside bright golden yellow. When the bird flies, the white rump is very prominent and makes the recognition of the flicker easy. This beautiful woodpecker is found throughout North America, as far west as Alaska, but in the United States it is confined to the country east of the Rocky Mountains. In the northern part of its range it is migratory, but it winters from Massachusetts and Illinois southward. It nests, like all woodpeckers, in holes in trees, and the eggs are white, five or more in number. When the nest is robbed, the female will con-

tinue to lay, until sometimes a great number have been deposited. In one case 71 eggs were laid in 75 days. The flicker feeds on worms, insects, and berries, and is often seen on the ground in search of food. The notes are varied, but the most familiar is a rapidly repeated, rolling call. There is also a frequent two-syllabled note, uttered in a high, nasal tone. The flicker enjoys the distinction of having more numerous popular names than any other American bird. No less than 36 have been recorded, the most common of which, besides the two already given, are high-hole, or high-holder, referring to the position of the nest; pigeon woodpecker, referring to the size and appearance on the ground; clape and yucker, which, like flicker, are supposed to imitate one of its notes; and yellow-hammer, referring to the color of the undersurface of the wings and its woodpecker habit of drumming on dead limbs.

The red-shafted flicker (*Colaptes cafer*, or *mexicanus*, *collaris*), west of the Rocky Mountains, is much like the common flicker in color, except that the underside of the wings and tail is orange red, and there is no red nuchal band; in habits it is exactly like the Eastern bird. A third species occurs in the valley of the Colorado River and southward, and three other species of the genus are found in the warmer parts of America.

Consult: Coues, *Birds of the Northwest* (Washington, 1874); Ingersoll, *Wild Life of Orchard and Field* (New York, 1902); Dawson, *The Birds of Washington* (Seattle, 1909). See WOODPECKER; and Plates of WOODPECKERS and of EGGS OF SONG BIRDS.

FLICK'INGER, DANIEL KUMLER (1824-1911). An American divine. He was born at Sevenmile, Ohio, and from 1857 to 1885 was secretary to the United Brethren Church Missionary Society, on behalf of which he made numerous tours in Africa. He became foreign missionary Bishop of the United Brethren in 1885. He wrote: *Offhand Sketches of Men and Things in Western Africa* (1877); *Ethiopia: or, Twenty Years of Missionary Life in Western Africa* (1877); *The Church's Marching Orders* (1879); *Fifty-five Years of Ministerial Life* (1907).

FLIEDNER, flēt'nēr, THEODOR (1800-64). A German Protestant philanthropist. He was born at Eppstein, Nassau, the son of a clergyman, and after studying at the universities of Giessen and Göttingen, became pastor of a small church at Kaiserswerth in 1822. He made a tour through Germany, Holland, and England to raise funds in behalf of his poor parish, and his success suggested to him the idea of his benevolent institutions and especially prison reform. In 1826 the first Society for Prison Reform of Germany was founded. In 1833 Fliedner opened at Kaiserswerth a refuge for discharged female convicts. To take care of the sick and poor, a hospital was built and a body of women trained for nursing. In 1835 he founded an infant school in Düsseldorf and in 1836 one in Kaiserswerth with a normal training school. In the latter year he founded also the first German Protestant establishment for deaconesses. King Frederick William IV of Prussia, and his Queen, Elizabeth, gave Fliedner their support and founded a Christian hospital with deaconesses at Berlin. His last years were spent in founding "mother houses" in Europe, America, and the East, and he wore out his life in his work. The sterner features of his character were re-

lieved by a humor that had full play in his intercourse with the children of his schools. Consult Winkworth, *Life of Pastor Fliedner of Kaiserswerth* (trans., London, 1867), and the biography in German by his son (Kaiserswerth, 3d ed., 1892).

FLIEGENDE HOLLÄNDER, flē'gen-de hōl'-lən-dēr, DER (Ger., *The Flying Dutchman*). An opera by Wagner (q.v.), first produced in Dresden, Jan. 2, 1843; in the United States, Jan. 26, 1876 (New York).

FLIES, SPANISH. See BLISTER BEETLE.

FLIGELY, flē-gā'lē, AUGUST VON (1811-79). An Austrian soldier, born at Janow, Galicia. He was director of the Military Geographical Institute at Vienna from 1853 to 1872 and president of the Austrian Geodetic Commission until 1875. His work in the department of triangulation, geodesy, and cartography was very important, and the Military Geographical Institute of Austria owes its present fame to his influence and activity. The employment of heliogravure in the preparation of the new special atlases of Austria was due to his initiative. A cape in Franz Josef Land and a fjord in Greenland were named in his honor.

FLIGHT (AS. *flyht*, from *flēogan*, Icel. *fljúga*, OHG. *flīogan*, Ger. *fliegen*, to fly). The power of progressing through the air by means of wings. It is possessed by bats and birds among existing vertebrates, by the extinct pterodactyls, or flying reptiles, and by a very large proportion of insects. No amphibian can fly, the nearest approach to flight being found in a frog (*Rhacophorus*) of Borneo, in which the webbed feet are so large as to serve the purpose of a parachute. That flying fishes actually "fly" has been asserted and denied with equal vigor; but very careful observers insist that the pectoral fins are not active but merely passive agents in sustaining the fish after it has sprung into the air, although, when a flying fish is laid on the deck of a vessel, the outstretched fins are often vibrated with great rapidity and considerable force.

Mechanism for Flight. The wings of vertebrates are modifications of the fore limbs; these in bats and pterodactyls support, or supported, a thin membrane, while in birds the bones support stiff feathers. In bats the thumb is free, the bones corresponding to the fingers of man greatly elongated. The membrane is not only spread between these, but continued from the little finger to the ankle joint, while there is, in addition, a greater or less amount of membrane sustained between the legs and tail, which helps support the body during flight. In pterodactyls the thumb was absent, the succeeding three fingers very small, the fifth or little finger enormously elongated. This supported the wing membrane in front, while the hinder margin reached to the ankle joint, or possibly in some species only to the hip. In birds the bones of the hand are reduced in number, and some of them are fused, to furnish a point of attachment for the feathers. In bats the strain of the wing is sustained by the greatly developed collar bone, or clavicle, which runs from the shoulder blade to the front end of the breastbone and furnishes a firm brace for the shoulder joint. The clavicle is absent in pterodactyls, and the shoulder joint is formed by the shoulder blade and a bone termed the coracoid, the two uniting to form a V, with the socket for the wing at the apex. One arm of the V rests against the backbone, the

other against the front part of the breastbone, thus forming an extremely firm brace for the wing. In birds (see BIRD) the shoulder joint is also formed by the shoulder blade and coracoid, but the shoulder blade runs backward, parallel with the body, the coracoid being attached to the front of the breastbone. This forms the most important support of the wing, for while the collar bones are present in the shape of the wishbone, they are by no means so important as is often supposed and, as in many small birds, may be of no use at all. The collar bones are strong and serve to brace apart the shoulders in birds like hawks and eagles, whose vigorous movements demand an extra strong support for the wing; but in humming birds and swifts the wishbone is feeble, although these birds have extraordinary powers of flight.

In insects the wings may be two or four in number, most commonly the latter, and, unlike the wings of vertebrates, they are not modified limbs, but specially developed parts believed by some to have been derived from the breathing organs of primitive aquatic forms. They are formed of thin, rather stiff membrane, braced by little ridges, termed "nerves," which are strongest on the front edge of the wing. This strengthening of the front margin is as absolutely essential as that the posterior portion should be flexible; any injury to this part of the wings destroys the power of flight, and flight is also impossible when the wing is made rigid. But a considerable part of the hinder portion of the wing may be removed without seriously impairing the ability to fly.

Flight Muscles. As in insects the hard parts are outside of the muscles, the wings are attached to the exterior of the body, and are not supported by an internal skeleton. The wings of vertebrates are moved by powerful muscles attached to the breastbone, and the depth of this portion of the skeleton is a rough measure of the muscular power used in flying. In such flightless birds as penguins, the breastbone is deeply keeled because the wings are used for swimming and moved by the muscles employed by other birds in flight. Among dragon flies the muscles are fastened directly to the base of the wings, much as in vertebrates; but in insects generally the wings are moved not only by these direct muscles, but by powerful cross muscles, which alter the curvature of the body and by so doing raise or depress the wings.

Modes of Flight. Broadly speaking, there are two modes of flight: (1) by repeated strokes of the wings; and (2) by gliding or sailing with outstretched, almost motionless, wings; but almost every intermediate condition is to be met with. The humming bird and albatross represent the extremes of these methods; the former moves the wings so rapidly that they are invisible, while the latter sails for long periods without a movement of its pinions. The common chimney swift is an excellent and familiar example of an intermediate state, vibrating its wings rapidly for a few strokes and then sailing.

The first method calls for a rather short and strongly built wing and large muscles; the second for a long wing and very little expenditure of muscular energy. The wings of the albatross are from 10 to 12 feet from tip to tip, and but 9 inches broad, while the muscular power of the bird is so slight that it cannot rise from the water when gorged with food. It is of interest to note that the long, narrow wing is the one

which, in theory as well as in practice, is best for sailing. Contrary to what might be supposed, the support of the wing is stronger in sailing birds than in others, reaching the maximum of strength in the frigate bird, which, though noted for its power of long-sustained flight, has very small muscles. Birds of prey exhibit a combination of the two methods of flapping and sailing, and their wing muscles are so powerful that they are able to carry away birds almost as heavy as themselves.

Birds that sail must obtain their initial velocity either by darting from some elevated place, by strokes of the wings, or by strokes of the wings aided by the wind, which they face when taking flight. (See below.) The albatross cannot rise from the deck of a vessel, and when taking wing on a calm day is obliged to flap along the water for a considerable distance. Once in the air the sailing bird utilizes to the utmost the momentum first acquired, and it is probable that the ever-changing force and direction of the wind is an important factor in sailing, the bird instinctively making use of every variation in the currents of air. As bearing on this it may be said that the system of muscles by which the movements of the outer parts of the wing are controlled is much more complex in sailing than in flapping birds.

Insects resemble humming birds in the comparative lack of flexibility in their wings and mode of flight, while, owing to the small size of the wings and the slight contractions of the muscles that drive them, they are moved with almost inconceivable rapidity, the smaller the wing the more frequent being its strokes. Thus, while the large moths and butterflies flutter slowly, the wings of the house fly, according to Marey, vibrate 330 times per second.

Bats, the only group of flying mammals, also fly entirely by means of wing strokes, the frequency of the stroke being in an inverse ratio to the size of the species, the small bats fluttering, the large fruit bats flapping their wings somewhat like a heron. The length and narrowness of the wings of pterodactyls, and the small surface for muscular attachment, indicate that these creatures sailed or flew with infrequent wing strokes, after the fashion of a chimney swift.

Relation of Size and Weight to Flight. It is an interesting question whether or not the animals that fly represent the limits of size and weight attainable by living creatures. The albatross, condor, swan, bustard, turkey, and pterodactyl represent the maximum of weight, but these range only from 15 to 30 pounds, and the spread of wings is but 7 feet in the swan, 8 to 10 feet in the condor, and 10 to 14 feet in the albatross. The largest examples of pterodactyls had a spread of wing of 20 feet; but owing to the small size of the body and wonderful lightness of the skeleton, their weight at the outside was not more than 30 pounds. These reptiles, with their great expanse of wing, offer one of the exceptions to the general rule that the wing area per pound is proportionally less in large flying animals than in small—a seeming anomaly which, though imperfectly understood, is partly based on the fact that the great sweep of a large wing makes it much more effective than one of small dimensions. Very erroneous ideas prevail both as to the power of the muscles and the speed attained by birds. Marey long ago showed that the contractile power of

the muscular fibres was certainly no greater in birds than in mammals, and observation has shown that even ducks, which fly very rapidly, seldom attain a greater speed than 35 to 40 miles an hour, although under favorable conditions some species may exceed this.

Flight of Birds. So long ago as 1680 an Italian, Borelli, propounded a theory of flight which in its essential feature holds good to-day. Noting that all wings are rigid in front, flexible behind, he considered that, as the wings were raised and lowered they formed obliquely directed planes alternately facing backward and forward, by which the bird was, so to speak, wedged through the air. More recently Professor Pettigrew, of England, and Professor Marey, of France, have studied the flight of birds, the latter in particular devoting much attention to the subject and devising very elaborate experiments to ascertain the action of the wings. Professor Marey was able to photograph the position of the wing at different phases of the stroke. This shows that the wing is not merely moved up and down, but that it has a variety of movements by which, combined with the resistance of the air, the wing assumes a somewhat twisted shape. According to Marey, the movements of the wing in a pigeon are briefly as follows:

At the commencement of the downward stroke the wings are spread to the utmost and brought downward and forward until their tips are in advance of the head. At the beginning of flight the downward movement is so great that the wing tips touch, while on their recovery they strike above the bird's back, producing the clapping sound so noticeable when pigeons take flight. The wing is now raised rapidly and at the same time flexed at the wrist joint, to be again straightened as the wings are raised to their full extent. In performing these motions the long axis of the wing describes an ellipse, being carried first forward and downward, then backward and upward. During the downward stroke the front edge of the wing looks downward, the undersurface of the wing being directed backward, these positions being exactly reversed during the upward stroke. It will be seen that by this disposition the wing has a propelling force during the downward stroke, while during the recovery, or upward movement, it acts as an inclined plane to raise the bird. There is, nevertheless, a rising and falling of the body, more or less pronounced, at every stroke, so that the forward path of the bird is not a perfectly straight line. Professor Pettigrew insists that during the downward stroke of the wing its undersurface is directly *forward*, and that the long axis of the wing describes a figure  at each stroke, and that the wing, by this screwlike action, acts much after the fashion of a propeller; but the results obtained by photography do not seem to bear out this theory.

The method of sailing flight is less easily explained because the results obtained seem out of all proportion to the force expended. Having obtained its initial velocity, the bird is held to avail itself of every increase or upward eddy of the wind to rise, although in doing this onward movement is checked. The bird then sails forward and downward, to rise again and repeat these movements. Soaring, or ascending in spirals, is performed by this method, aided by upward currents of air. The difficulty in the way

of this theory is that birds progress for long distances almost horizontally, while we cannot suppose that convenient upward currents are everywhere to be met with. But the experiments of Lilienthal have shown how little force is necessary for gliding flight, since by jumping from an elevation he was able, with the aid of wings of his invention, to sail for upward of a quarter of a mile. For power of long-distance flight, see *MIGRATION OF ANIMALS*.

See *AERONAUTICS*.

FLIGHT INTO EGYPT, THE. A subject frequently treated by painters, especially during the Renaissance. It represents Joseph, the Virgin, and the infant Jesus, fleeing into Egypt to escape the persecutions of Herod. The Virgin, with the Child in her arms, is usually mounted on the ass led by Joseph, and sometimes angels or other figures are introduced. Well-known examples are by Giotto, in the Lower Church at Assisi and the Arena Chapel, Padua; Claude Lorrain, in the Dresden Gallery; Rubens, in the Louvre; Tintoretto, in the Scuola di San Rocco, Venice; Van der Werff, in The Hague; and two by Murillo, in the Musée Galliera, Paris, and the Hermitage, St. Petersburg. A variation of the same subject, "Repose on the Flight to Egypt" (or "Repose in Egypt"), is depicted with equal frequency. In this case the Madonna is usually seated under a tree with the Christ child in her lap, while Joseph secures dates from a neighboring palm. Good examples are those by Gerard David in the J. P. Morgan collection (Metropolitan Museum, New York); by Albrecht Altdorfer in the Munich Gallery; Correggio in the Parma Gallery and the Uffizi, Florence; Van Dyck, in St. Petersburg, Pitti Palace (Florence), and Munich Gallery; Murillo, in St. Petersburg and the collection of the Earl of Strafford; Paul Veronese, in Munich; Poussin, in the Louvre; and Delaroche, in the Wallace collection, London.

FLIGHTLESS BIRDS. Certain groups and species of birds lack the power of flight. Such birds fall into two categories: (1) ratite birds; and (2) groups or isolated species among carinate birds distinguished from their fellows by this disability. The ratite birds (see *RATITÆ*) form a primary group, comprising the moa, epornis, and other fossil or extinct forms, and the existing kiwis (*Apteryx*), ostriches, cassowaries, emus, and rheas. They are distinguished as a class by the fact that the median line of the breastbone is not produced into an elevated ridge or "keel," as is the case with all other, or

carinate, birds, where this keel is required to give attachment to the great pectoral muscles that move the wings. It is believed, however, that the ratite birds are a modified, not to say degenerate, offshoot from the primitive carinate stock, originating at a very early day in adaptation to life upon open plains, where, from lack of enemies or for some other reason, the use of the wings was less advantageous than ability in other directions and consequently disappeared. Such birds are now denizens almost exclusively of plains and deserts. See *CASSOWARY*; *KIWI*; *MOA*; *OSTRICH*; and similar titles.

In the case of the other category various circumstances seem to have brought about the flightless condition. In some, indeed, it is only partial, while others have completely lost the use of their wings for flying. Among the latter are the penguins, in which the wings have been converted into paddles, an adaptation to the requirements of a pelagic bird whose prey is caught under water; the same was true of the extinct great auk (see *GAREFOWL*); and in the Mesozoic *hesperornis* the loss extended to a complete disappearance of any external wings whatever. Another striking example is furnished by the extinct dodo and solitaire (qq.v.) of Mauritius and Rodriguez islands, whose wings had become small and totally useless, owing, it is believed, to the fact that through innumerable generations these birds had found no advantage in their possession, but rather a disadvantage in the prevailing high winds which often made it unsafe to fly much above the trees lest the birds be blown to sea. A fact parallel with this is the wingless condition on these islands of various insects belonging to classes that are elsewhere in full possession and use of their wings. A precisely similar instance, also, is found in a rail isolated on the island of Tristan d'Acunha, which has lost the power of flight and whose wings have nearly disappeared. (See *RAIL*.) Another curious instance of the flightless condition is afforded by an extinct goose (*Onemionis caloitrans*) of New Zealand, remains of which are found in that country, but the epoch to which they should be referred is uncertain, probably the Pleistocene. The duck *Nesonetta*, confined to the Auckland Islands, near New Zealand, is a similar case. Harris's cormorant is another of the several further examples which might be cited of the effect of isolation (q.v.) on islands as affecting flight. It is an inhabitant of the Galapagos Islands. See *HESPERORNIS*.

FLINCK, GOVAERT (1615-60). A Dutch genre and portrait painter. He was born in Cleves, Jan. 25, 1615, and was at first placed with Lambert Jacobs, a Mennonite preacher and painter of Leeuwarden. This was the home town of Saskia, wife of Rembrandt, and through her relatives he learned of the great master at Amsterdam and became his pupil. In his earlier works he followed Rembrandt so closely that their paintings are difficult to distinguish. Establishing a studio at Amsterdam in 1636, he became well known as a portrait painter, and received many official commissions. The arrangement of his compositions is good; the treatment is broad, with warmth of color in the flesh tones; the pose of the heads natural and full of animation. But after about 1648 his art visibly deteriorated—he abandoned Rembrandt's style, strove to imitate the ample forms and exaggerated action of Rubens, and adopted

a mannered academic mode of painting. He died at Amsterdam Feb. 2, 1660, leaving a large collection of antiquities, drawings, and engravings valued at 12,000 florins. Excellent examples of his early manner are "Isaac Blessing Jacob" (1638), in the Museum of Amsterdam; the "Regents" (1642), and "The Company of Orange" (1645), both in the City Hall, Amsterdam; "Celebration of the Peace of Münster" (1648), Museum of Amsterdam, considered by many his masterpiece; "Expulsion of Hagar," Berlin Museum. The two important works of his later period are "Solomon Asking for Wisdom" and "Curius Dentatus Refusing the Presents of the Samnites," both in the Royal Palace, Amsterdam. Among his best portraits are "Man with a Gray Beard" (1639, Dresden); "Man with his Sister" (1646, Rotterdam); "A Young Man" (Hermitage, St. Petersburg). He is represented by other pictures in the galleries of Berlin, Dresden, Munich, Vienna, Brussels, in the Louvre, and elsewhere. He enjoyed the patronage of the Elector Frederick William of Brandenburg and of Maurice of Nassau, Stadtholder of Cleves, who often visited his house. Consult Havard, *L'Art et les artistes hollandais*, ii (Paris, 1880), and Van Dyke, *Old Dutch and Flemish Masters* (New York, 1901).

FLINDERS, MATTHEW (1760-1814). An English navigator and hydrographer, born at Donington, Lincolnshire. He studied geometry and navigation by himself and in 1789 entered the royal navy as a midshipman. After active service in European waters and in the West Indies he was attached in 1795 to the *Reliance* on which Captain Hunter, the Governor of New South Wales, had taken passage to Australia. Flinders spent five years on that continent, devoting the greater part of his time to geographical discoveries and coast surveys. He circumnavigated Tasmania in a small sloop and made exact geographical observations and calculations regarding the island. He was promoted a lieutenant in 1798 and on his return to England was placed in command of the ship *Investigator*, with instructions to return to New Holland, as Australia was then called, and complete a systematic survey of its coast. Flinders sailed from England in the *Investigator* on July 18, 1801, and, beginning with Cape Leeuwin on the southwest coast, spent the following two years in mapping the coast line east and northward as far as the Gulf of Carpentaria on the north coast. Being unable to complete the survey of the west coast, owing to the unseaworthiness of the *Investigator*, he started to return to England in a small ship; but having unfortunately stopped at Mauritius on his way, he was detained there a prisoner for six and a half years. Released at length, he returned to England broken in health and completed the account of his voyage and discoveries only a short time before his death. He was promoted to the grade of captain in 1810. Flinders ranks as one of the world's greatest hydrographers, and his survey of the Australian coast still forms the basis for the modern charts. He was also the first successfully to investigate the errors of the compass due to the attraction of iron in a ship. His account of his voyage was published in the year of his death (1814), under the title *A Voyage to Terra Australis* (2 vols., with atlas). Consult also a "Memoir" in the *Naval Chronicle*, vol. xxxii (London, 1815).

FLINDER/SIA (Neo-Lat., named in honor of

Capt. Matthew Flinders). A genus of trees of the family Rutaceæ. One species, *Flindersia australis*, yields a heavy, hard, and often dark timber that is inferior to mahogany. It is much used in Australia and is there called Flindosa ash, or crow's ash. The tree is of rather rapid growth, specimens 100 to 150 feet in height and 4 to 6 feet in diameter being reported. *Flindersia owleyana*, a tree 150 feet high, furnishes a light yellow wood and is considered one of the finest Australian hardwoods for cabinet work. A yellow dyestuff is also prepared from this species. *Flindersia maculosa*, called leopard tree, is a smaller species, the timber of which is used for shingles, barrel staves, etc. A gum that exudes from this tree in considerable quality resembles gum arabic and makes good mucilage. *Flindersia australis* is said to be a valuable street tree in the tropics. Its fruits are rough and according to Maiden are used as rasps in preparing roots, etc., for food. See OXLEYA.

FLINDERS LAND (named in honor of Captain Flinders). The name early given to South Australia, but now confined to Flinders County.

FLINDERS PETRIE, W. M. See PETRIE.

FLINDO'SA. See FLINDERSIA.

FLING, FRED MORROW (1860-). An American historical writer, born at Portland, Me. He graduated from Bowdoin College in 1883 and from the University of Leipzig (Ph.D., 1890). In 1891 he became professor of European history at the University of Nebraska. He founded the Association of Nebraska Teachers of History in 1897 and became one of the electors to the Hall of Fame. Besides many papers on historical subjects, he is author of *Outline of Historical Method* (1898); *Studies in Greek Civilization* (1898); *A Source Book of Greek History* (1907); and these important works on French history: *History of France*, in the "History of the Nations Series" (1907); *Source Studies on the French Revolution* (1907); *The Youth of Mirabeau* (1908); *Source Problems on the French Revolution* (1913).

FLING, HIGHLAND. See HIGHLAND FLING.

FLINS DES OLIVIERES, flân dâ zô'lé'vyâ', CHARLES LOUIS MARIE EMMANUEL CARBON DE (1757-1806). A French poet, born in Rheims. He was King's officer for some time at Vervins and wrote there a poem *Voltaire* (1779). Under the pseudonym Louis Emmanuel he wrote *Les voyages de l'opinion dans les quatre parties du monde* (1789-1800). His other works include: *Les amours avec un essai sur la poésie érotique* (1780); *Poèmes et discours en vers* (1782); *Plan d'un cours de littérature* (1784); and the comedies *La jeune hôtesse* (1792), which was imitated from Goldoni's *Locandiera*; *Le mari directeur* (1791); and the cleverly planned *Le réveil d'Épiménide* (1790).

FLINT (AS. flint, OHG. flins, dialectic Ger. Flins; probably connected with Gk. πλινθος, plinthos, brick). A massive variety of quartz somewhat similar to chalcedony, but usually of dark colors, as gray and brown. It is generally found in the form of nodules in deposits of chalk, especially in the chalk cliffs of England. It is of wide occurrence and is found chiefly in the counties of Kent, Norfolk, and Suffolk, England, where it was formerly used as a building material, and in Cretaceous limestones of the United States. Microscopic examination of flint shows that it contains spicules of sponges and frustules of diatoms, which have suggested

that these served as a nucleus around which the silica was deposited from solution. According to Pliny, Clias was the first to strike fire with flint, and its use for sharp weapons and cutting instruments such as axes, arrowheads, knives, etc., is evident from its discovery among the earliest prehistoric relics. The readiness with which it produces fire when struck with steel leads to its extensive use for igniting tinder and its employment as gun flints; but these uses have been superseded by matches and percussion caps, and its principal application at present is as an ingredient of fine pottery, for which purpose it is calcined, thrown into cold water, and then finely powdered. Consult: Evans, *Ancient Stone Implements, Weapons, and Ornaments of Great Britain* (London, 1872); Stevens, *Flint Chips* (ib., 1870); Wilson, "Arrowpoints, Spearheads, and Knives of Prehistoric Times," in *Report of United States National Museum for 1897*.

FLINT. The capital of Flintshire, Wales; a seaport and municipal borough since 1284, on the estuary of the Dee, 13 miles southwest of Liverpool (Map: Wales, C 3). Only vessels of small draft can enter its port. It is a smoky little town, possessing lead and coal mines, copper and chemical works. Pop., 1901, 4279; 1911, 5472. Roman relics and traces of Roman lead-smelting works have been found. Flint was made a borough by Edward I, who built the castle, which still exists, but in a ruined state. Richard II, on Aug. 19, 1399, surrendered to Bolingbroke at Flint Castle, and in 1647 the fortress was captured by the Parliamentarians, who dismantled it four years later.

FLINT. A city and the county seat of Genesee Co., Mich., 72 miles by rail north-northwest of Detroit, on Flint River, and on the Pere Marquette and the Grand Trunk Western railroads (Map: Michigan, F 6). It is the seat of the State institution for the deaf and dumb, and among other features are Oak Grove Hospital, a private retreat for the insane, fine high school and Federal buildings, a public library, courthouse, and city hall. The city is one of the most important centres in the United States for the manufacture of automobiles, buggies, carriages, and varnishes, and has also flouring mills, grain elevators, ironworks, electric-stove works, cigar factories, brick and tile works, etc. It trades extensively in grain. Flint, then known as the Grand Traverse of the Flint, was settled in 1820 and in 1855 was chartered as a city. It owns its water works. Pop., 1900, 13,103; 1910, 38,550; 1914 (U. S. est.), 49,546.

FLINT, ALBERT STOWELL (1853-). An American astronomer. He was born at Salem, Mass., and was educated at Harvard (A.B., 1875) and the University of Cincinnati (A.M., 1880). He served as computer of the United States Naval Observatory in 1881-83 and 1888-89 and as assistant to the United States Transit of Venus Commission in 1883-88. At the University of Wisconsin he was assistant astronomer of the Washburn Observatory from 1889 to 1904, when he became astronomer. He became a fellow of the American Association for the Advancement of Science. He is author of *Meridian Observations for Stellar Parallaxes*, vol. xi of the *Publications of Washburn Observatory* (1902).

FLINT, AUSTIN (1812-86). An American physician, born at Petersham, Mass. He was educated at Amherst and Harvard and grad-

uated at the latter in 1833. After practicing in Boston and Northampton, he removed to Buffalo, N. Y., in 1836. He was appointed professor of the institutes and practice of medicine in Rush Medical College, Chicago; resigned after one year, in 1846, and established the *Buffalo Medical Journal*. With White and Hamilton he founded the Buffalo Medical College in 1847, where he was professor of the principles and practice of medicine for six years. He was afterward professor of the theory and practice of medicine in the University of Louisville, Ky., from 1852 to 1856. He was then called to the chair of pathology and clinical medicine at Buffalo. From 1858 to 1861 he was professor of clinical medicine in the School of Medicine at New Orleans. In 1859 he removed to New York and in 1861 was appointed visiting physician to Bellevue Hospital; from 1861 to his death, in 1886, he was professor of the principles and practice of medicine in Bellevue Hospital Medical College (consolidated with the medical department of New York University in 1898), and from 1861 to 1868 he was professor of pathology and practical medicine in Long Island College Hospital. He was president of the New York Academy of Medicine from 1872 to 1885 and president of the American Medical Association in 1884. His published works include: *On Continued Fever* (1852); *Chronic Pleurisy* (1853); *On Dysentery* (1853); *Physical Exploration in the Diagnosis of Diseases of the Respiratory Organs* (1856; revised 2d ed., 1868); *Diseases of the Heart* (1859; 2d ed., 1870); *Principles and Practice of Medicine* (1866; revised 5th ed., 1884); *Medical Essays on Conservative Medicine and Kindred Topics* (1874); *Clinical Medicine* (1879); *On Phthisis* (1883); *Manual of Auscultation and Percussion* (revised 3d ed., 1883). Consult his biography, by Carpenter (New York, 1886).

FLINT, AUSTIN (1836-). An American physician, born at Northampton, Mass., son of Austin Flint (q.v.). He attended medical lectures at the University of Louisville from 1854 to 1856 and in 1856 and 1857 at Jefferson Medical College, Philadelphia. From 1857 to 1859 he was editor of the *Buffalo Medical Journal*, surgeon of Buffalo City Hospital, and professor of physiology and microscopical anatomy in the University of Buffalo. In 1859 he removed to New York with his father and was appointed professor of physiology in New York Medical College. He was professor of physiology in the New Orleans Medical College in 1860 and studied in Europe in 1860 and 1861. He was professor of physiology and microscopic anatomy in Bellevue Hospital Medical College, New York City, from 1861 till this institution was consolidated with the medical department of New York University in 1898, when he was appointed professor of physiology in Cornell University Medical College. He was, in 1874, Surgeon-General of New York State. He carried out extensive experimental investigations in human physiology and made several important discoveries. He assisted in establishing the glycogenic function of the liver; showed that one of the functions of the liver is to separate from the blood the cholesterin, which is a product of the nervous system, and which, becoming a constituent of the bile, is afterward converted into what he named "stercorin," the odorous principle of the faeces. His principal works are: *The Physiology of Man* (4th ed., 1888); *Chemical Examinations*

of Urine in Diseases (6 eds., 1870-84); *Effects of Severe and Protracted Muscular Exercises* (1871); *Source of Muscular Power* (1878); *Text-Book of Human Physiology* (1875); *Experiments Regarding a New Function of the Liver, Separating the Cholesterol of the Blood and Eliminating it as Stercorin* (1862); *The Physiology of the Nervous System* (1872); *Mechanism of Reflex Nervous Action in Normal Respiration* (1874); *The Treatment of Diabetes Mellitus* (1884); *Chemical Examination of the Urine in Disease* (1893); *Stercorin and Cholestercemia* (1897); *Handbook of Physiology* (1905).

FLINT, CHARLES RANLETT (1850-). An American merchant and banker, born at Thomaston, Me. He graduated from the Brooklyn Polytechnic Institute in 1868. As a partner in Gilchrist, Flint & Co. and W. R. Grace & Co. he became interested in South American commerce. In 1877-79 he was Consul for the Chilean government in New York and later Consul General of Costa Rica and Nicaragua to the United States. In 1885 he became a member of the firm of Flint & Co., established by his father and uncle in 1837, and in 1889-90 he was a delegate to the International Conference of American Republics. He sold 20 submarines and torpedo boats to Russia and fitted out a fleet of war vessels for Brazil in 1895. In the following year he established the Coast Clipper Line, in 1897 he superintended the consolidation of the Syracuse street railways, and at the beginning of the Spanish-American War he negotiated the purchase of additional warships for the United States. He also became known as the organizer of various corporations.

FLINT, JOSEPH MARSHALL (1873-). An American surgeon, born in Chicago. He studied at Princeton, graduated from the University of Chicago (B.S., 1895) and from Johns Hopkins (M.D., 1900), and also studied in Leipzig, Vienna, Bonn, and Munich. He served as an assistant in anatomy in 1897 and associate in 1900-01 at the University of Chicago and as assistant to the Johns Hopkins Medical Commission to the Philippines. After special work for the United States Marine Hospital Service at San Francisco he was professor of anatomy at the University of California from 1901 to 1907, when he was appointed to the chair of surgery at Yale. He also became attending surgeon of the New Haven Hospital and chief surgeon of the New Haven Dispensary. From 1903 to 1907 he edited the *American Journal of Anatomy*, contributing, besides, to other medical journals articles on anatomy and surgery.

FLINT, ROBERT (1838-1910). A Scottish theologian, born in Dumfriesshire. He studied at Glasgow University, from 1859 to 1864 was pastor at Aberdeen and Kilconquhar, and was professor of moral philosophy and political economy in St. Andrews University (1864-76) and then professor of divinity in Edinburgh University. He was Stone lecturer at Princeton University in 1880, Croall lecturer at Edinburgh in 1887-88, and a foreign correspondent of the French Institute. His works include: *Christ's Kingdom on Earth* (1865); *Philosophy of History in Europe* (1874); *Theism and Anti-Theistic Theories* (1877), possibly his most important work and typical of his intuitionism; *Historical Philosophy in France* (1894); *Socialism* (1894); *Sermons and Addresses* (1899); *Agnosticism* (1903); *Philosophy as Scientia Scientia-*

rum (1904); *On Theological, Biblical, and Other Subjects* (1905).

FLINT, TIMOTHY (1780-1840). An American author, born at North Reading, Mass. He was a graduate of Harvard, and then a Congregational pastor until 1815, after which for 10 years he was a missionary and teacher in the Mississippi valley. Then, with little health and fortune left, he took up editorial work on the *Cincinnati Western Review*, and the *Knickerbocker Magazine* (1833), and devoted himself to the writing of his novels and other works relating to the West and Southwest. He resided at Alexandria, Va., in the winter and in New England in the summer. The best of the novels is *Francis Berrian* (1826), a tale of Mexico. His *Recollections of Ten Years Passed in the Valley of the Mississippi* (1826) was also popular, and he wrote geographies and lectures on natural history, did some translating, and furnished the London *Athenæum* with an early account or résumé of American literature. Altogether, he was an important man in his day, though now forgotten. He had a curious experience in his Massachusetts parish, somewhat recalling the fate of Gerbert, except that his ignorant parishioners thought that his chemical researches proved him to be a counterfeiter, not the Devil. Consult J. E. Kirkpatrick, *Timothy Flint, Pioneer, Missionary, Author, Editor* (New York, 1911).

FLINT GLASS (so called because the silica used in its manufacture was first derived from flint). A glass whose chief constituents are the silicates of lead and potassium. It has an index of refraction of 1.62-1.63 for yellow (sodium) light, and on account of its greater dispersive power is used in combination with crown glass in the construction of achromatic prisms and lenses. See GLASS; ACHROMATISM.

FLINT IMPLEMENTS. These products of handiwork are interesting to the archaeologist, the technician, and the ethnologist. The word "flint" must be taken to mean siliceous stones that may be flaked and fashioned into implements. For the latter word students have substituted the term "artifacts." Not only tools and weapons, but ornaments, art treasures, and objects used in cults and ceremonies were made of flint from Point Barrow to Fuegia in America, and everywhere in the Old World, excepting in places that do not furnish materials. The sources of material were the open fields, boulder beds, and exposures of undisturbed rock. The savages camped near the larger supplies, and first with hammers knocked off coarse spalls, then finer chips; finally, with pointed implements of bone, using pressure, they acquired marvelous skill in flaking the refractory materials into the desired shape. Much of the last-named process, however, was done at their homes. These ancient workshops are among the most interesting of remains, since they reveal the steps in the earliest of human industries.

Flint artifacts of the implement class pierce, cut, and abrade. They were arrow, lance, spear, and harpoon heads, and bits for drills; those of the edge class were knives and saws; the abraders were scrapers for the men and skin dressers for the women. In those regions where calcareous flint, beautiful varieties of quartz, jaspers, carnelian, and obsidian abound, the æsthetic sense was awakened and stimulated. In public museums and private collections will be

found tiny arrowheads perfectly made, and immense ceremonial spearheads over a foot long, having their surfaces finished exquisitely. Flint artifacts are one of the chief concerns of the archaeologist. At the present time this class of artifacts excites unusual interest. The history of prehistoric Europe is written chiefly in them; Egypt reveals an age of chipped flint antedating all the Pharaohs; from India come products of great beauty in this art; the occurrence of rude forms in the Quaternary deposits of western Europe is held to have thrown far back the life of man on the globe. The literature of the subject is vast and almost hopelessly scattered. Fortunately the *Journal of the Anthropological Institute*, of London; the *Bulletin de la Société d'Anthropologie*, of Paris; the *Zeitschrift für Ethnologie*, of Berlin; the Bureau of American Ethnology and the United States Museum in Washington have each issued a catalogue with up-to-date index of the subject. The *American Anthropologist* has a bibliography in each number. Besides these works, consult: Mortillet, *Le préhistorique* (Paris, 1910); Thomas, *Introduction to the Study of North American Archaeology* (Cincinnati, 1898); Moorehead, *Stone Age in America* (Boston, 1910); Obermaier, *Der Mensch der Vorzeit* (München, 1912). The older works of Evans, Baldwin, Short, are still useful. See ARCHÆOLOGY, AMERICAN.

FLINTLOCK. See SMALL ARMS.

FLINT RIVER. One of the principal rivers of Georgia, rising near Atlanta, and flowing in a general southwestern direction to the southwestern corner of the State, where it joins the Chattahoochee, forming the Apalachicola (q.v.) (Map: Georgia, B 4). Its length is about 350 miles; it is navigable for small river craft as far as Albany, 150 miles above its junction with the Chattahoochee, and for heavier vessels to Bainbridge, about 50 miles. It drains an area of more than 8000 square miles.

FLINTSHIRE. A maritime county of North Wales, bounded on the northeast by the Dee, on the east by Cheshire, on the south and west by Denbighshire, and on the north by the Irish Sea (Map: Wales, C 3). Area, 257 square miles, of which one-seventh is arable. The coast, 20 miles long, is low and sandy, but on the Dee estuary fertile. A hill range, parallel to the Dee, runs through the length of the county and rises in Garreg to 825 feet. Another range along the southwest border of the county rises in Moel Famma, 1845 feet. The chief rivers are the Dee, Alyn, and Clwyd. The mining industries are the most important. Coal, and ores of iron, lead, silver, copper, and zinc are the chief mineral products and exports. The chief towns are Flint, the county town; St. Asaph, Holywell, and Havarden. Pop., 1901, 60,536; 1911, 69,722.

FLIOMA, flī-ō'mā, or **FLIAUM**, flī-ōm'. The orange rockfish (q.v.), one of the most abundant and marketable of that group of fishes in California.

FLITCH OF BACON. See DUNMORE FLITCH OF BACON.

FLITTERMOUSE. See BAT.

FLIX/WEED. See HEDGE MUSTARD.

FLOATING AXLE, IN MOTOR VEHICLE. See MOTOR VEHICLE.

FLOATING BATTERY. A vessel with very feeble motive power, or none at all, but heavily gunned, and usually well protected by armor. It is designed to operate in smooth water. See ARMOR PLATE; SHIP, ARMORED.

FLOATING BEACONS. See BUOY; LIGHT-HOUSE.

FLOATING HEART. See VILLARSIA.

FLOATING ISLAND. A mass of soil and organic matter floating in placid water. Floating islands are formed either by the detachment of portions of the bank in which the network of roots is sufficiently strong to withstand the action of waves, or by aggregations of driftwood in rivers and bays of tropical regions. They may be covered with herbage and trees, and animals taken by surprise while roaming upon them may go on an unexpected journey when the mass starts seaward. They have been found at long distances from land, and it is believed that they may have served to distribute organic forms over insulated regions, such as the islands of the South Pacific. Many lakes in Prussia, France, and England are noted for their floating islands; but the best examples, perhaps, are the great masses of vegetation which collect in the White Nile. These masses, called "sudd" by the Egyptians, must be broken up at regular intervals in order to keep the waters open to navigation.

FLOATING MEADOW GRASS. See MANNA GRASS.

FLOATING PLANT. See HYDROPHYTE.

FLOATS (AS. *flota*, Icel. *floti*, OHG. *floz*, Ger. *Floss*, float, raft, from AS. *flēotan*, Icel. *flota*, OHG. *flozzan*, Ger. *flößen*, to float, launch; connected with Lith. *plūditi*, to swim, Lat. *pluere*, to rain, Gk. *πλεῖν*, *plein*, to sail, Skt. *plu*, *pru*, to swim). In agriculture very finely ground mineral phosphate, used as a fertilizer. See MANURES AND MANURING.

FLOBERGE, flō'bārzh'. The sword of Renaud de Montauban, in the romance of that name.

FLODDEN FIELD. A plain in Northumberland, England, at the base of Flodden, the northeastern spur of the Cheviot Hills. It is famous as the battlefield where James IV of Scotland was defeated by an English army under the Earl of Surrey, Sept. 9, 1513. Henry VIII of England had declared war against Scotland's ancient ally, France. James IV sent him a peremptory demand to desist and, on Henry's refusal, gathered an army computed at 100,000 men, which however dwindled to 30,000 before crossing the border. James had taken up his position on Flodden Hill, when the Earl of Surrey with 32,000 men, by a skillful movement from the southeast, cut off his communications with Scotland. Observing that the English were strengthening their position, James ordered an advance at four in the afternoon, and a desperate battle ensued. The right wing of the English army, led by Sir Edmund Howard, was defeated by the left wing of the Scottish army, led by the Earls of Huntly and Home, who did not follow up their success. A furious charge of the Scottish right on the English left was repulsed with great slaughter. Meanwhile a desperate resistance was being made by the Scottish centre, where the King fought on foot among his noblemen. Surrounded by outnumbering enemies, they fought bravely until darkness came on, and the King fell pierced by an arrow and mortally wounded in the head. The hill was held during the night by the Scots; but at dawn, seeing the hopeless nature of affairs, they abandoned their position. Their loss amounted to from 8000 to 10,000 men. Besides the King, the Archbishop of St. Andrews and 12 earls were killed, and there was scarcely a notable

Scottish family without a representative among the slain. The English loss amounted to 4000. The sixth canto of Sir Walter Scott's poem "Marmion" gives a fairly accurate description of the action. Consult White, *The Battle of Flodden* (London, 1859).

FLODOARD, flōdō's'ār' (894-966). A canon of Rheims, noted for his historical writings. His most important works are *Historia Ecclesiæ Remensis* (to 948), and his *Annales* (919-966). These are of the greatest importance for a knowledge of the history of the tenth century. In addition he wrote a number of other works, some in verse. The best edition of the *Annales* is published by the Picards in their *Collection de textes*, vol. xxxix (Paris, 1905). For other editions, etc., consult: Wattenbach, *Deutschlands Geschichtsquellen*, vol. i (7th ed., Stuttgart, 1904); Molinier, *Les sources de l'histoire de France*, vols. i, v (Paris, 1902, 1904).

FLOE RAT. The ringed seal (*Phoca hispida*), commonly observed in the Arctic-Atlantic regions lying upon the ice floes. See **SEAL**.

FLÖGEL, flō'gel, KARL FRIEDRICH (1729-88). A German literary historian. He was born at Jauer, Silesia, studied theology at Halle, and became professor of philosophy at the Ritterakademie at Liegnitz in 1774. His reputation rests upon the work entitled *Geschichte der komischen Litteratur* (4 vols., 1784-87), in which the author, after a general preliminary treatise, reviews the history of satire among the Greeks, Romans, and the various nationalities of modern Europe; the fourth volume being devoted to the comedy, farce, and comic opera. As a continuation of the work, the author published the supplementary productions, *Geschichte des Grotesk-komischen* (5th ed., 1888); *Geschichte der Hofnarren* (1789); *Geschichte des Burlesken* (1793).

FLOGGING. The infliction of blows by a rod or scourge, especially when directed by a court or by one who is invested with public authority. In barbarous times scourging in various forms was common to all nations; it was a common practice among European nations down to modern times. With a defective system of detention, flogging appeared to be the most effective method of dealing with petty offenses. In the army and navy of England this method of punishment existed until a comparatively recent date, being finally discontinued under a regulation of 1881; and it is only in late years that it has practically disappeared. In the United States the penalty of flogging has been abolished everywhere except in the State of Delaware, where its employment persists in spite of an active movement for its abolition. Flogging is still generally practiced in Russia as a part of prison discipline. See **PUNISHMENT**; **CAT**.

FLOOD. See **INUNDATION**; **DELUGE**.

FLOOD, HENRY (1732-91). A British politician and orator. He was born in Ireland, was educated at Trinity College, Dublin, and at Christ Church, Oxford, and in 1759 entered the Irish House of Commons. Here he soon attracted attention by his eloquence, which, combined with his high social standing, made him a leader of the popular party. He was afterward for some time Privy Councillor for the two kingdoms, and Vice Treasurer for Ireland, but lost the latter office (1781) because of his strong Nationalist sympathies. Disliking Grattan's Irish Bill of Rights on the ground of its not going far enough, Flood quarreled with his for-

mer friend. His career in the English House of Commons (1783-90—he was still a member of the Irish House) was not marked by success. He was the author of some poems and of a volume of *Speeches* (1787) that are noteworthy for their good style and logical method. Consult Warden Flood, *Memoirs of Henry Flood* (Dublin, 1838), and Lecky, *Leaders of Public Opinion in Ireland* (2d ed., New York, 1903).

FLOOD PLAIN. A level land area on a river border, formed in times of inundation by depositions of silt, sand, or gravel, which have been eroded and transported from higher land. Owing to frequent additions of new material, the soil of flood plains, or bottom lands as they are popularly called, is fertile and highly productive, but often subject to damage by flood and in northern districts by frost. Notable examples of flood plains are the valleys of the rivers Nile, Mississippi, Ganges, Danube, and Po. See **RIVER**; **VALLEY**.

FLOOR (AS, Icel. flōr, Ger. Flur, Ir., Gael. lár, Corn. Ior, Welsh llawor, Bret. lewr; ultimately connected with OPruss. plonis, barn floor, Lith. plonas, flat, Lat. planus, level, Gk. πλάτ, plax, level surface). 1. In architecture, the horizontal surface which forms the bottom plane of any inclosed building or part of a building, or the top surface of a bridge, terrace, or platform. Hence also, by extension, a story or entire section of a building between two floors or between a floor and roof. In the numbering of floors in this sense, the American usage, unlike the English, generally begins with the ground level, or the floor above the basement or cellar as the first floor, the English numeration beginning with what is commonly called the second floor in America. The term is moreover employed in buildings, by the usage of both countries, to designate not merely the surface or floor proper, but also the entire construction which provides and supports it. The flooring is the material which forms this surface; it may be of boards, tiles, stone slabs, concrete, iron, or any other material. In buildings of several stories the floor construction forms at once the floor of the story above it and the ceiling of the story below. In ordinary houses and nonfireproof buildings the single floor is used. In this a single system of beams, called joists, carries the flooring of boards, which may itself be single or double; the boards, usually tongued and grooved, being nailed directly to the joists. These are usually 2 or 3 inches thick and from 8 to 12 inches deep. In old work, and sometimes still in Europe, the joists are thick, often square in section, which is a much less economical construction, as their strength varies as the square of their depth, but only directly as their thickness. A double floor is one in which the joists are carried by girders, and the ceiling below by a second set of lighter joists called ceiling joists. In England the girders are called binding joists and the floor joists bridging joists. In these floors the girders are set 6 or 8 feet apart, and the bridging joists are therefore light, usually 2 × 6 inches in section. In a double-framed floor there are heavy main girders which carry the binding joists upon which in turn rest the bridging joists. When thin deep joists are used, if longer than 8 feet, they are commonly bridged or cross-braced at intervals of 6 feet; this gives greater stiffness and distributes the load upon any given point. When a double flooring of wood is to be laid, the under or rough flooring is often laid diag-

onally on the joists, and upon this the finished flooring of narrow strips of hard wood, tongued and grooved, is *blind-nailed*, i.e., nailed through the edge of each strip so that the nails are invisible on the finished floor. In "slow-burning" or "mill" construction, there are no joists; heavy beams take their place, spaced 4 to 6 feet apart, and the flooring is of narrow planks 4 inches thick. There is no underceiling, so that the hollow flues for the spread of fire which exist in ordinary floors are wholly avoided.

Fireproof floors are constructed on a great variety of systems, divided into two chief classes—those with metal beams and those constructed wholly of concrete. In the first class the spaces between the beams are filled with flat arches of hollow brick, or with curved arches of solid brick, or with reinforced concrete. Strips or sleepers of wood are buried in cement laid on the top of this construction, to which the wooden flooring is nailed; or the flooring is itself also fireproof, of cement, tiles, mosaic, or *terrazzo* (q.v.), or of some special composition. In floors of the second class, beams of reinforced concrete are spaced from 4 to 8 or 10 feet apart, and the filling is also of reinforced concrete, from 3 or 4 to 8 inches thick. Floors are made waterproof by layers of asphalt or by sheets of lead laid under the finished flooring. In buildings which are vaulted—common in Europe, but rare in America—the back of the vaulting is filled up level with rubble or concrete and the flooring laid upon it as described above.

Floors in monumental buildings have offered in all ages an opportunity for fine decorative effects. In Rome and Pompeii mosaic of small *tesserae* of marble, porphyry, etc., was used in interesting all-over patterns, and colored marbles, cut into ornamental panels (*opus sectile*), formed the floors of temples and baths. This art was extended by the early Christian and Byzantine artists in their churches, with the addition of *opus alexandrinum*, a mosaic of small triangles, squares, etc. The mediæval builders paved the floors of chancels and chapels with enameled tiles, and in Italy sometimes with superb inlays of black marble on white (baptistry of Florence; Siena Cathedral). Modern practice has appropriated all these forms of decorative art in the decoration of floors. See MOSAIC; CARPENTRY; FIREPROOF CONSTRUCTION; CONCRETE. Consult bibliographies on these articles.

2. In parliamentary law (q.v.), the right or privilege of addressing the chair or the assembly.

FLOORCLOTH. A cloth covering, used as a substitute for or protection of carpets. See LINOLEUM; OILCLOTH; KAMPTULICON.

FLOQUET, flô'kâ', CHARLES THOMAS (1828–96). A French statesman and journalist, born at Saint-Jean-de-Luz in Basses-Pyrénées. He was educated for the bar at Paris, and while still a student took part in the revolution of 1848. He was not reconciled to the coup d'état of Louis Napoleon and was one of the bitterest opponents of the Second Empire, being one of the accused in the celebrated Trial of the Thirteen. In 1867, on a state visit of the Czar Alexander II to the Palais de Justice, he cried from among the lawyers in their robes, "Long live Poland!" In 1870 he represented the family of the murdered Victor Noir in the case against Pierre Bonaparte. In the organization of the Government of National Defense in 1870 and during the subsequent siege of Paris, Floquet was extraordi-

narily active and was later chosen as representative to the National Assembly by the Department of the Seine. During the Commune (q.v.) Floquet attempted to mediate between the revolutionary leaders and the Versailles government, but was so radical in his sentiments that he was arrested in 1871 and suffered a month's imprisonment at Paris. In 1872 he appeared in public life as a radical Republican, and in 1876 entered the Chamber of Deputies, voting always with the Extreme Left. Politically he stood with Clémenceau, farther to the Left than either Gambetta or Ferry. The same year he established the Radical journal *Le Peuple*. He was made Prefect of the Seine in 1882, but reentered the Chamber soon after, and in 1883 took the initiative in demanding the proscription of the princes. From 1885 to 1888, when he became Prime Minister, he was president of the Chamber. The height of his popularity was reached in 1888 after the famous duel in which he wounded General Boulanger (q.v.) in the throat. He was successful in 1889 in his hard political struggle against Boulanger only by abolishing the *scrutin de liste* method of voting which had been Boulanger's main source of power. In February, 1889, on the defeat of his projected constitutional amendment, he resigned the premiership. The Panama disclosures in 1892–93 implicated Floquet and injured his political standing, although he was elected to the Senate in 1894. He died Jan. 18, 1896. Consult: Proth, *Célébrités contemporaines*, vol. ii (Paris, 1883); *Discours et opinions de M. Charles Floquet*, ed. by A. Faivre; Hanotaux, *Histoire de la France contemporaine* (4 vols., Eng. trans., 1903); G. Weill, *Histoire du parti républicain en France* (Paris, 1900).

FLOR, flôr, ROGER DI, or ROBERT BLUM (c.1202–1307). A Catalan chief, of German descent. He was born at Brindisi, and as a young boy entered the service of the Templars, and later joined their order. He fought in Palestine, but was accused of robbery at the capture of Acre by the Mohammedans in 1291 and had to escape. He went to Sicily and became vice admiral of King Frederick's fleet; in 1303 a band of free lances chose him their chief, and he led them to Constantinople, where they served Andronicus Palæologus against the Turks. (See CATALAN GRAND COMPANY.) Roger was made Grand Duke and in Asia Minor warred against the Turks, of whom he is said to have killed 30,000. But he plundered the Greeks and pillaged Philadelphia, which he had rescued from the Turks. The Emperor tried to retain him in his service, but was unable to satisfy his demands for money. Finally, when Roger went to visit Michael, the Emperor's son, he was assassinated. His death aroused his soldiers against the Greeks, and a fierce war followed. Consult Pears, *Destruction of the Greek Empire* (London, 1903).

FLORA (Lat., from *flos*, flower). Among the Romans, the name of the goddess of flowers and of the spring, identified by the poets with the Greek Chloris. In Rome she had a temple on the Quirinal and another in the vicinity of the Circus Maximus. The worship of Flora was one of the oldest manifestations of the Roman religious feeling and is affirmed to have been introduced by Numa. She had a *flamen* called the *flamen Floralis*. The *floralia*, or festival in honor of the goddess, first instituted 238 B.C., and made a regular festival in 178 B.C., was

celebrated from April 28 to May 3, with much licentious merriment. This festival lasted into the fourth century A.D. On coins Flora is represented with a crown of flowers. Consult Fowler, *The Roman Festivals* (London, 1899), and Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912). See FLOWER.

FLORA. The aggregate of plants growing spontaneously in a country or district, as the flora of Illinois or the flora of a pond. In the latter example the term is ecological and is the equivalent of plant society, but in most cases the term "flora" has no ecological significance. See DISTRIBUTION OF PLANTS; ECOLOGY; TAXONOMY.

FLORA. A city in Clay Co., Ill., 96 miles east of St. Louis, on the Baltimore and Ohio Railroad (Map: Illinois, H 8). It contains a Carnegie library and the Orchard City College. There are manufactories of butter and ice cream, a cannery, apple evaporators, and a railroad roundhouse. The water works and electric-light plant are owned by the municipality. Pop., 1900, 2311; 1910, 2704.

FLORA'LIA. A Roman festival. See FLORA.

FLORÉAL, flô'râ'âl' (from Lat. *florēus*, relating to flowers, from *flos*, flower). The eighth month in the French Republican calendar. It extended from April 20 to May 19 in the years I-VII, and from April 21 to May 20 in the years VIII-XIII. See CALENDAR.

FLORE ET BLANCHEFLEUR, flôr & blâns'h'flêr'. The title of an old French romance, so called from the names of the lovers—Flöre, a Christian knight, and Blanchefleur, a Saracen slave. The story is used in Boccaccio's *Il Filocopo*, by Chaucer in the Franklin's tale, and appears in a number of English versions.

FLORENCE (It. *Firenze*, Lat. *Florientia*, from *florere*, to bloom, from *flos*, flower). The most important city of central Italy north of Rome, on the Arno, in lat. 43° 46' N., and long. 11° 15' E., 60 miles east of Leghorn and 140 miles northwest of Rome (Map: Italy, C 3). Florence, founded later than the neighboring Fiesole, was an important Roman colony; during the later Middle Ages and the Renaissance a free city dominant in Tuscany; from 1569 capital of the Grand Duchy of Tuscany, from 1855 to 1871 of the Kingdom of Italy, and since then of the Province of Florence.

Situation and Topography. From its beautiful situation at the foot of the Apennines, in a valley bordered with gently sloping hills, covered with olive groves, orchards, and vineyards, and crowned with pines, it has derived the title *Firenze la Bella* (Florence the Beautiful). The surrounding country, dotted up to the mountain tops with white villages, pleasant villas, and beautiful suburbs, is the fairest imaginable. The title "Beautiful" is even more richly deserved by reason of its clean streets, well-preserved ancient buildings, and art treasures, representing the most perfect development of the Renaissance. More than any other city, Florence was the cradle of Italian culture. She was the first to produce a native literature, which made her vernacular the written language of Italy; the first to take up the study of the ancient languages, art, and science, and to achieve an artistic development rivaled only by that of Athens. The number of her great men is legion—no city since antiquity can show such a roster; to mention only a few: Dante, Giotto, Masaccio, Donatello, Leonardo, Michelangelo, Galileo, and Alfieri. In Florence, too, perhaps

more than in any other Italian city, a glorious past is united with an attractive present.

The Arno divides the city into two unequal parts, the chief of which stands upon the northern bank. Here lay the Roman city, the rectangular shape and straight streets of which may be traced in the heart of mediæval Florence. By the eleventh century new walls were necessary, and in 1285 arose the third and finest circuit, strengthened by 150 towers, "encircling the city like a garland." Although these walls were removed to make room for new driveways, some of the grand old city gates still remain. The Arno is spanned by four ancient stone and two modern iron bridges. Of the former the most interesting is the Ponte Vecchio (1355), which replaced an ancient structure of 1177, affording, with its rows of goldsmiths' shops, an interesting example of the mediæval custom of using bridges for trade. The most beautiful bridge is the Trinità, built in 1567-70, after Ammanati's design.

Squares and Monuments. The general appearance of old Florence is one of republican seriousness and simplicity—the abode of a prosperous and industrious, but warlike merchant and artisan class. The well-paved, cleanly streets are narrow, the houses are high, and the very palaces are fortress-like in character. But all is leavened by an ever-present sense of the fitting and the beautiful. The principal squares, with famous historical or artistic associations, are named after some contiguous church or prominent building.

The Piazza della Signoria, flanked by the grim Palazzo Vecchio, and the beautiful open Loggia dei Lanzi, was the centre of the civic life of Florence. There the great state ceremonies were performed, and the many political experiments of Florence were adjudged by the tribunal of popular revolution. Until 1873 it contained Michelangelo's "David," typical of Florentine liberty, and it still possesses Bandinelli's "Hercules and Cacus," Ammanati's "Fountain of Neptune," and Giovanni Bologna's statue of Cosmo I. The centre of Florentine religious life was the Piazza del Duomo, in which stand the cathedral, the campanile, and the venerable baptistery where every true Florentine was baptized. The Florentines traded in the Mercato Vecchio, now Piazza Vittorio Emanuele, which contains a statue of the first monarch of that name. Other famous ancient squares are that of the Annunziata, with its arcades and the fountains of Tacca, and the statue of Ferdinand I by Giovanni Bologna; Santa Maria Novella, where public games were celebrated; and Santa Croce, with the monument to Dante.

The new quarters of Florence extend beyond the ancient city walls, the site of which has been converted into fine driveways, the *viali*. The most beautiful of these is the Viale dei Colli, passing over the hills on the southern border and offering fine views of the city. Among the most important modern squares are the Piazza d'Azeglio and the Piazza dell'Indipendenza. The Piazzale di Michelangelo, near San Miniato, with its bronze cast of Michelangelo's "David," affords a marvelous panorama of Florence and the vicinity. The principal public gardens are the Giardino di Boboli, beautifully laid out and containing numerous works of art, and the Cascine, where on Sundays and holidays the *corso* takes place. As regards both heat in summer and cold in winter, the climate

FLORENCE
CATHEDRAL OF SANTA MARIA DEL FIORE (UPPER)
PONTE VECCHIO AND PORTICO OF THE UFFIZI GALLERY (LOWER)

of Florence is extreme and, for Italy, subject to sudden changes.

Churches and Palaces. Although the buildings of old Florence are remarkable as works of architecture, in which some of them, indeed, were epoch-making, they are no less so by reason of their historic associations, and especially for the works of painting and sculpture which they contain. The earliest surviving examples are constructed in a species of Romanesque, more closely related to the antique than this style is elsewhere, and characterized especially by beautiful marble incrustation. The most prominent examples are the exquisite little church of San Miniato and the basilica Santi Apostoli—both probably dating from the eleventh century—and, especially, the baptistery (San Giovanni), probably originated in the seventh century, but in its present form dating principally from the twelfth century. Its three bronze portals, one by Andrea Pisano and two by Ghiberti, one of which is the Paradise portal, mark epochs in the development of Florentine sculpture.

A most remarkable activity in building was evinced in the last decades of the thirteenth century, from which date the principal Gothic buildings of Florence. The oldest of the churches is Santa Maria Novella (1278), the central seat of the Dominicans, constructed by two monks, Fra Sisto and Fra Ristoro. A monument of simple architectural grandeur, it is even more famed for its Gothic paintings by Cimabue, Andrea Orcagna, and the Giotteschi in the Spanish Chapel, and its Renaissance frescoes by Filippo Lippi and Ghirlandaio. Equally celebrated is Santa Croce (q.v.), church of the Franciscans and the Florentine Pantheon. The cathedral, begun probably in 1298, continued throughout the fourteenth century, and completed, excepting the façade, in the fifteenth (consecrated in 1436), owed its construction to the patriotism of the citizens. Among its architects were Arnolfo di Cambio, the original designer, Giotto, Francesco Talenti, Ghiberti, and Brunelleschi. The exterior is celebrated for its marble incrustation, the interior for its wide vaulting and the many works of art it contained, some of which, like the "Singing Galleries" of Donatello and Luca della Robbia, have been removed. The celebrated cupola belongs to the Renaissance (see below); the façade, though in the Gothic style, is modern, having been begun in 1875 and unveiled in 1888.

The campanile (bell tower), begun in 1334 and built after Giotto's designs, is pure Italian Gothic; light and airy in construction, adorned with reliefs and statues by the most celebrated Florentine sculptors of the fourteenth and fifteenth centuries, this is the most beautiful tower of its kind in the world. Among the civic buildings of the same epoch is the grim and fortresslike Bargello (c.1250), once palace of the podestà. With its mighty bell tower and walls of rough-hewn stone, the Palazzo Vecchio formed a typical seat of the ever warlike and alert government of Florence. The usual ascription of this building to Arnolfo is not certain, and it was not erected in 1298, but in 1300-1301. Nor was Andrea Orcagna the architect of the Loggia dei Lanzi, which was begun in 1374, years after his death, by Simone Talenti. This fine open hall, once used to protect from the weather the participants in the great state ceremonies, which were conducted in the presence of the people,

has become the model for such buildings. Half church, half guildhall, the Late Gothic Or San Michele, begun in 1337 by Orcagna, possesses in its tabernacle and in the statues of its niches an epitome of early Florentine sculpture.

The entrance of the Renaissance into Florence is associated with the many works of Brunelleschi. First of all, and his principal constructive work, stands the cupola of the cathedral (1421-34), the first great dome in the history of modern art. Modeled upon that of the Pantheon, which somewhat exceeds it in diameter, though not in height, it is second only to St. Peter's in magnitude. Other important churches are San Lorenzo (1421) and Santo Spirito (1443) and the beautiful little Pazzi Chapel (1420), while in the grim Palazzo Pitti, or Pitti Palace (q.v.), Brunelleschi erected a model of palace construction in rough-hewn stone. A frowning exterior, coupled, however, with light and attractive courtyards, is characteristic of Florentine palaces of the fifteenth century. The most important are Palazzo Riccardi by Michelozzo, once the residence of the Medici; Palazzo Strozzi (1489), perhaps the most beautiful in Florence, by Benedetto da Maiano, and with cornice by Cronaca; and Palazzo Rucellai, by Leonbattista Alberti. The High Renaissance is not so well represented; among the best examples are Raphael's Palazzo Pandolfini (1530) and the new sacristy of San Lorenzo, by Michelangelo.

Educational Institutions. As a principal centre of Italian science and art, Florence has always been the seat of a number of important educational institutions and art collections. The ancient university (1349) is now organized as an Institute of Higher Study; the time-honored school for notaries is now combined with a higher gymnasium. The most important of the art schools, the Accademia delle Belle Arti, possesses a fine collection illustrative of early Florentine painting, and Michelangelo's "David." Chief among the incomparable art collections of Florence are those of the Palazzo Pitti and the Palazzo degli Uffizi. (See PITT PALACE; UFFIZI PALACE.) The Archaeological Museum, rich in Etruscan antiquities, is now housed in the Palazzo Crocetta, and the Museo Nazionale, important for early Florentine sculpture, in the Bargello. The Opera del Duomo contains many treasures made for the baptistery and the cathedral, and in the old house of Michelangelo is the Museo Buonarroti, a collection of his works and designs. Among the many and important Florentine libraries are the Laurentian, begun in 1444 by Cosmo de' Medici and incomparably rich in classic manuscripts; the National Library (which receives a copy of every book printed in Italy), composed principally of the Biblioteca Magliabecchiana, founded by Magliabecchi in 1747, and possessing about half a million volumes, besides pamphlets, letters, prints, etc.; the Marucelliana (1713), with a fine collection of prints; and the Ricciardana. The Florentine archives (Archivio Centrale) are universally rich and well organized.

Industries, etc. The great wool and silk industries, which formed the economic basis of the past greatness of Florence, have long since decayed; at present the manufacture of art objects is the most important. Especially celebrated are modern Florentine mosaics of colored marbles, the finest of which are made in the royal factory, founded in 1574, and there are

numerous establishments for sculpture in marble, alabaster, and serpentine, for wood carving, and for the manufacture of stained glass. There are also silk and hat manufactories, jewelry works, porcelain potteries, and glass factories. The water supply, derived from reservoirs 7 miles north of Florence, is supplemented by a modern hydraulic system which draws the water from the river. There are an American consul and vice consul. The population in 1901 was about 165,000, the population of the commune being 205,589; communal population in 1911, 232,860. The increase in population is chiefly due to immigration, the birth rate in recent years having frequently fallen below the death rate. The city is growing in every direction, and the new quarters show better sanitary methods than those of earlier years, but in most cases an absence of the artistic qualities which characterize those of the older sections of the city.

History. Originally a market place situated at the base of the high hill crowned by the ancient Etruscan city *Fæsulæ* (Fiesole, q.v.), Florence was probably founded about 187 B.C., in connection, it has been thought, with the building of a road from Bononia (Bologna, q.v.) to Arretium (Arezzo, q.v.), later part of the Cassian Way (q.v.). Its importance begins with the establishment of a Roman military colony in its precincts, decreed by Sulla, but carried out by Augustus. (For another evidence of its importance at this time, see *CHIARA*.) Under the Emperor Hadrian the Cassian Way was extended through Florence, greatly increasing the town's importance. Tombs found under the pavement of the *Vicolo del Campidoglio* show that back of the Roman city was a settlement of the villanova (q.v.) period. Remains, too, of the Roman *capitolium*, of baths, two theatres, and an amphitheatre have been found. (Consult Davidsohn, *Geschichte von Florenz*, vol. i, Berlin, 1896; id., *Forschungen zur älteren Geschichte von Florenz*, vol. i, ib., 1896). In the fourth century A.D. it became the seat of a Christian bishop and was the capital of the Province of Tuscia-Umbria. In 401 Radagaisus, at the head of an innumerable horde of barbarians, besieged the city, but was defeated, and his army was destroyed by Stilicho, general of the Emperor Honorius. In 542 Totila, the Gothic King of Italy, besieged Florence, but did not capture it. Under the Lombards Florence was the capital of a dukedom. Although Charles the Great may have greatly benefited the city, the former belief that it lay desolate until in 799 he ordered its walls and public buildings rebuilt is untenable.

In 1115 Florence, with a part of Tuscany, was bequeathed to the popes by the Countess Matilda, who had inherited the civic jurisdiction from her mother, the Countess Beatrix. During her rule the people of the city had obtained some power, and the *boni homines* or *sapientes* presided over the courts when Matilda was not present. The city was already at that time noted for its wealth.

It received an influx of population from the inhabitants of Fiesole, when their hill town was destroyed in 1125. During the bitter wars between Pope and Empire, Florence and Tuscany for a time stood aloof from the civil feud which raged throughout Italy; but in 1215 Florence became involved in the great party struggle, and for 33 years the city was distracted by the

deeds of bloodshed and violence of two rival factions, who assumed the names and adopted the respective causes of Guelph and Ghibelline. (See *GUELPHS AND GhibELLINES*.) After 1115 the government of the city had been in the hands of a comparatively few families, presided over by 12 consuls assisted by 100 *boni homines* chosen by the greater guilds. In 1250 the citizens rebelled against the nobles and overthrew their authority. Twelve magistrates, or *anziani*, were chosen annually in place of the consuls. Two other magistrates, strangers by birth, were elected—one, the *podesidà*, was invested with supreme authority in civil and criminal cases; the other, with the title of the captain of the people, had the chief command of the militia, in which were enrolled all the youth of the state, who were bound at the call of this magistrate and the "sound of the bells," the historic Florentine tocsin, to join their countrymen fully equipped for fight; 20 companies defended the town, 96 the country. After the death of the Emperor Frederick II, the great protector of the Ghibellines, the Guelph, or papal, party gradually rose in power in Florence, and during 10 years of grandeur and prosperity under their ægis the city stood not only the first in Tuscany, but one of the first of all Italy. In 1254 the Florentines first coined their golden florin, which commemorated a period of great success in the annals of Florence, whose forces had humbled Siena, Arezzo, Pisa, and Pistoia, in 1252, and in 1254 captured Volterra. In 1260 the standard of civil war was again raised by the Ghibellines of Florence, who, in league with Manfred of Naples, attacked the Guelphs and cut their forces to pieces in the sanguinary battle of Montaperti. The conquerors entered Florence in the name of Manfred, abolished the popular institutions, established an exclusively aristocratic executive, and even strongly advocated the entire destruction of the city as the hotbed of Guelphism. This barbarous scheme was strenuously and successfully resisted by their leader, Farinata degli Uberti, immortalized by Dante. Pope Urban IV, French by birth, summoned against Manfred a French army, led by Charles of Anjou (brother of King Louis IX), to whom he offered the Kingdom of the Two Sicilies. Manfred was defeated and slain in the battle of Benevento, and Guelph ascendancy was restored throughout Italy and in Florence.

In 1266 Charles fully restored to the Florentine people their internal institutions and received their offered allegiance for 10 years. In 1282 the *priori*, a new executive and commercial power, consisting of the presidents of the greater arts or guilds, were established in Florence; in 1293, by the consent of the *priori*, a higher chief was elected, with the title of *gonfaloniere*. In 1300 Dante was one of the *priori*, when the civil feud assumed a new form in the strife between the two factions into which the Guelph party had split, the Neri (blacks) and the Bianchi (whites), the latter of whom soon became identified with the Ghibelline cause. Their dissensions were interrupted by the appearance of Charles of Valois, invited by Boniface VIII to restore tranquillity, in 1301. Charles espoused the part of the Guelphs, or Neri, and sanctioned every outrage on the Bianchi, who were plundered and barbarously murdered, the survivors being exiled and beggared. Among these were Dante and the father of Petrarch. In 1306 Pistoia was

besieged and taken by famine with great barbarity. In 1315 the Florentines met with a severe check from the Ghibellines of Pisa, and between 1320 and 1323 were repeatedly defeated by Castruccio Castracani, Chief of the Republic of Lucca. Weakened by long dissensions, and alarmed by Castruccio's threat of marching on the city, the citizens appealed to the King of Naples for aid. They received joyfully an officer of the King, entitled the Duke of Athens, sent as royal vicar, whom they proclaimed dictator of the Republic. His intrigues to overturn the Republic caused a general popular rising and his expulsion in 1343. After an aristocratic régime of the wealthier merchant guilds there came, in 1378, a revolution of the wool combers for the benefit of the lowest classes. Under the leadership of Michele di Lando they dominated the city three years, imparting certain permanent democratic tendencies.

The chief power of Florence was then alternately wielded by the democratic families of the Alberti and the Ricci, and by their patrician rivals, the Albizzi, who for the space of 53 years guided the Republic in the path of independence and progress. In 1406 the Republic of Pisa fell under the sway of Florence, after a most heroic resistance. From 1434 the history of Florence is intimately connected with the house of Medici, whose influence supplanted that of the Albizzi. (See MEDICI.) Under Lorenzo de' Medici (1449-92), styled *Il Magnifico*, Florence was the great centre of the Renaissance movement which revived the arts and elegances of antiquity. The prophetic fulminations of the Dominican friar Girolamo Savonarola (q.v.), whose influence lived long after he was martyred at the stake in 1498, resulted in the expulsion of the Medici from Florence in consequence of their licentious lives, extravagance, and their aiming at sovereign power. They were restored in 1512 and again expelled in 1527. To their intrigues Florence owed her final loss of republican rights and institutions. Pope Clement VII, of the house of Medici, formed a league with the Emperor Charles V, by which the liberties of Florence were to be extinguished and the sovereign power invested in the son of Giuliano de' Medici, Alessandro de' Medici, who had married the Emperor's natural daughter. In September, 1529, an army of Imperialists under Emperor Charles V entered Tuscany; on Aug. 9, 1530, the siege of Florence terminated after a defense marked by devotion and bravery on the part of the citizens, in which Michelangelo as the Republic's engineer, greatly distinguished himself. Ducal government was established in 1532, and in 1569 the Florentine dominions were erected into the Grand Duchy of Tuscany. In 1859 Tuscany was annexed to the Kingdom of Sardinia, and in 1865 Florence replaced Turin as the capital of the new Kingdom of Italy. In 1871, however, the capital was removed to Rome.

FLORENCE. A city and the county seat of Lauderdale Co., Ala., 126 miles by rail southwest of Nashville, Tenn., on the Tennessee River, at the foot of the Muscle Shoals Canal, and on the Louisville and Nashville and the Southern railroads (Map: Alabama, B 1). It is finely situated on a plateau 200 feet above the river and is the seat of a State normal college, and of a normal school for negroes, founded in 1903. Other features are the steel railroad and passenger bridge across the Tennessee, and Wildwood Park, of 250 acres. An old military road, cut out by General Jackson from New Orleans to Nashville, passes through the city. The manufactures include wagons, wooden pumps, stoves, boilers, engines, pig iron, cotton-seed oil, fertilizers, staves, cotton yarns and cloth, and are developing rapidly. Lumbering and mining are carried on. Plans are under way for developing the power of the Muscle Shoals, which have a potential capacity of some 450,000 h. p. Florence was laid out in 1819, received a city charter in 1889, and adopted the commission form of government in 1914. Pop., 1900, 6478; 1910, 6689.

FLORENCE. A city and health resort in Fremont Co., Colo., 32 miles by rail west by north of Pueblo, on the Atchison, Topeka, and Santa Fe, the Denver and Rio Grande, and the Florence and Cripple Creek railroads, and on the Arkansas River (Map: Colorado, D 3). There are petroleum-oil wells and coal mines in the vicinity, and the city has oil refineries, ore mills, and gold-reduction works. It is also engaged in truck gardening. The city owns its water works. Pop., 1900, 3728; 1910, 2712.

FLORENCE. A city and the county seat of Florence Co., S. C., 102 miles north by east of Charleston, on the Atlantic Coast Line and the South Carolina Western systems (Map: South Carolina, E 2). It is in a fertile agricultural region, carries on an extensive trade in cotton and tobacco, and has tobacco warehouses, stemmeries, and drying plants, cottonseed-oil mills, machine shops, railroad repair shops, lumber mills, etc. The city contains the South Carolina Industrial School, a State agricultural experiment station, a fine Federal building, a national cemetery, and an old Confederate prison stock-

ade. Florence adopted the commission form of government in 1913. It owns its water works and sewage system. Pop., 1900, 4647; 1910, 7057.

FLORENCE, COUNCIL OF. See FERRARA-FLORENCE, COUNCIL OF.

FLORENCE, WILLIAM JERMYN (1831-91). A popular American comedian, born at Albany, N. Y., his original name being Bernard Conlin. After some experience as an amateur and in minor parts at various theatres, his real work as an actor began at Brougham's Lyceum, New York, 1850, where in 1851 he made a hit in the part of a fireman. In 1853 he married Mrs. Malvina Pray Littell, with whom he won great applause in *The Irish Boy* and *Yankee Girl*, repeated in London three years later. Among his most successful characters were also Bardwell Slote in *The Mighty Dollar*, Bob Brierley in *The Ticket-of-Leave Man*, and Sir Lucius O'Trigger in *The Rivals*. This last he played to the Bob Acres of Joseph Jefferson, with whom he appeared in a number of pieces from 1889 till his death, which occurred in Philadelphia. Consult: McKay and Wingate, *Famous American Actors of To-Day* (New York, 1896); Matthews and Hutton, *Actors and Actresses of Great Britain and the United States* (ib., 1886); Winter, *The Wallet of Time* (2 vols., ib., 1913).

FLORENCE CRITTENTON MISSION, NATIONAL. An organization established in 1883 by Charles F. Crittenton (q.v.). Its general object is to assist all women who are in trouble. Especial attention is paid to cases of young girls who have gone astray; these are provided with shelter and cared for. Employment is secured for them and they are encouraged to return to a normal life. The association supports homes in seven cities in the United States, one in Tokyo, Japan, and one in Marseilles, France. The headquarters of the national mission are in Washington, D. C. The largest work of the mission is carried on at the Florence Crittenton home in New York City. Here there have been assisted nearly 900 girls. The work of the mission in New York City is closely connected with the night courts and other municipal courts. There are summer homes at Ossining, New York, and Ocean Grove, New Jersey, and here girls are given a chance for vacation and fresh air.

FLORENCE OF WORCESTER, wus'tēr (?-1118). An English chronicler and monk, who lived at Worcester. His *Chronicon ex Chronicis* drew material largely from the work of Marianus, an Irish monk, who had written a general chronicle, containing facts on the history of Britain and Ireland; it is a valuable authority on early English history. As continued up to 1141 by John of Worcester, Florence's work was edited by Thorpe (1848-49) and translated by Stevenson in vol. ii of *Church Historians of England* (1853) and by Forester in Bohn's *Antiquarian Library* (1854).

FLORENT, flō'rān', FRANÇOIS. A French jurist of the seventeenth century. He was born at Arnay-le-Duc and was professor of canonical law at Orléans and Paris. His works have been published by Doujat (1679; reprinted, 1763).

FLORENTIA. See FLORENCE (ITALY).

FLORENTINE SCHOOL OF PAINTING. The most important Italian school during the fourteenth and fifteenth centuries. It was eminent in individuality and intellectual qualities, its members often being sculptors and scientists

as well as painters. Their works are excellent in line and composition and are well modeled, showing the influence of Florentine sculpture, but are not so rich in color as the Venetian. Florentine art is the most decorative of all Italian painting, being mostly fresco work. The Florentine school attained its high position through Giotto (c.1266-1337), and throughout the fourteenth century it remained dominant in Italy. The painting of the Renaissance originated in Florence, in the works of Masolino and Masaccio, spreading thence throughout Italy. During the fifteenth century the Florentine was the first school of Italy and the world. Among the many artists which it produced at this period the most important, besides those mentioned, are Fra Angelico, Filippo and Filippino Lippi, Botticelli, Domenico Ghirlandaio, and Andrea del Verrocchio. Florentine art was characterized at this time by a vigorous naturalism, which was replaced during the sixteenth century by a growing imitation of the antique. Florence produced two of the greatest masters of the High Renaissance, Leonardo da Vinci and Michelangelo, to say nothing of others like Fra Bartolommeo and Andrea del Sarto, and the influence of its masters was determinative in forming Raphael's art. But its chief artists migrated to other cities, forming the Lombard and Roman schools, and during the sixteenth century Florence lost the primacy.

Consult authorities on Italian painting under PAINTING, e.g., Crowe and Cavalcaselle, *History of Painting in Italy* (ed. Douglas, London, 1903-11); Berenson, *Florentine Painters of the Renaissance* (New York, 1904); Cartwright, *The Painters of Florence* (ib., 1901). See also RENAISSANCE ART.

FLORES, flō'rēs. A mountainous island in the Azores, the most westerly of the group. Area, 57 square miles. The products are cattle and poultry. Near the island in 1591 took place the fight between the British warship *Revenge* and several Spanish warships. Pop., 1900, 8141. Chief town, Santa Cruz.

FLORES, flō'rēs. An inland department of Uruguay. Area, 1744 square miles. Pop., 1912, 20,181. The surface is rolling and well watered. Cattle raising is the principal industry. Considerable wheat and corn are produced. Capital, Trinidad.

FLORES, flō'rēs. An island of the Malay Archipelago, lying halfway between Java and Timor, between lat. 8° and 9° S. and long. 120° and 123° E. (Map: East Indies, F 7). It measures 224 miles in length by an average breadth of 35, with an area of about 5859 square miles. Its surface is mountainous, rising in parts to 8000 feet, and covered with forests. Several volcanoes are intermittent; Gunung Api is in continual activity. The soil is fertile. There is a scanty export to Celebes of sandalwood and birds' nests. Rubber culture has been attempted and has met with considerable success. Pop. (est.), 250,000. The government is administered by native chiefs, but the island is a dependency of the Dutch residency of Timor, the claim of Portugal having been vacated in 1859.

FLORES, flō'rēs, JUAN JOSÉ (1800-64). A Spanish-American soldier, and the first President of the Republic of Ecuador, born at Puerto Cabello, Venezuela. He fought under Bolívar in the War of Independence and in 1828 became commander in chief in the campaign against

Peru. When in 1830 Ecuador became independent and framed a constitution, he was elected President. Succeeded by Rocafuerte in 1835, he continued to be commander in chief of the army. In 1839 and 1843 he was reelected to the presidency, which in 1845 he resigned in consequence of a military revolution instigated by the Liberals, and voluntarily expatriated himself to Europe. He remained 15 years away from Ecuador. In 1863, at the call of the Ecuadorians, he again drew his sword in their defense and saved them from losing their liberty under the attacks of General Franco.

FLORES, VENANCIO (1809-68). A Spanish-American marauding adventurer and soldier and a president of Uruguay, born in Paysandú. In 1853 he was leader of the so-called "Colorados," or advanced party, in the revolt (started under circumstances that were peculiarly traitorous and repellent) against the government and was himself elected president. A counter-revolt having arisen in 1855, he withdrew to the Argentine Confederation, whose military service he entered. Aided by President Mitre of the Confederation and by Brazil, in 1865 he entered Montevideo in triumph and became Provisional Governor of the Republic of Uruguay. In 1866 he was elected President. He joined Brazil and Argentina in the triple alliance against Paraguay and for a time commanded the allied forces. The Emperor of Brazil had conferred upon him the rank of Prince, on the occasion of decorating him with the grand cross of the Order of the Cruzéiro. On Feb. 15, 1868, he resigned the presidency and four days afterward was assassinated during disturbances incident to a recurrence of revolution.

FLORES/CO, or FLORESCU, JOAN EMANUEL (1819-93). A Rumanian soldier and politician. He was born at Rimnik, studied at Bucharest, and at the Ecole d'Etat-Major of Paris, and during the Crimean War served as a colonel in the Russian army. Previous to 1877 he was several times Minister of War and effected many reforms in the military establishment of Rumania. In 1890 he became President of the Senate, and in March-December, 1891, he was President of a Conservative ministry. His policy was strongly influenced by friendship for Russia.

FLORESIS HUMMER. See HUMMING BIRD.

FLOREZ, fló'râth, HENRIQUE (1701-73). A Spanish theologian, archæologist, and historian, born at Valladolid. He wrote many works on the history and archæology of his country, among which are: *Llave historial* (1743); *La España sagrada—teatro geográfico histórico de la iglesia de España*, his most important work (51 vols., Madrid, 1747-73); *España carpetana, medallas de sus colonias, municipios y pueblos antiguos de España* (3 vols., ib., 1757-75), completed by Risco Fernández and others; *Memorias de las reinas católicas* (2 vols., ib., 1761).

FLOREZ (fló'râth) ESTRADA, ALVARO (1769-1853). A Spanish political economist. He was born at Pola de Somiedo, Asturias, of which province he became procurator general in 1808. He took the initiative in the uprising against Napoleon I, and as an ardent patriot again defended the rights of the nation as against King Ferdinand VII in his *Representación á Fernando VII*, which created a great stir and was frequently reprinted and translated. His *Curso de economía política* (6th ed. in 2 vols., 1843) was first published in France

during his exile (1828); and a French translation appeared in 3 vols. (Paris, 1833).

FLORIAN, fló'rê-ân', JEAN PIERRE CLARIS DE (1755-94). A French poet and romancer. He was born near Anduze, Languedoc, of noble and partly Spanish blood, and was related to Voltaire, who patronized his youth, as other powerful men of culture did his maturity. He served for a time in the army, but soon resigned to devote himself to literature. He was imprisoned at the outbreak of the French Revolution and did not long survive the effects of his incarceration. He first attracted attention in 1782 by versified epistles and eclogues, imitated Cervantes and Gessner in his *Galatée* (1783) and Fénelon and Marmontel in *Numa Pompilius* (1786), an educational work of wide popularity. This opened to him the Academy (1788), and in that year he published his once famous pastoral *Estelle*. The *Gonzalve de Cordoue* (1791) and his collection of *Fables*, in the manner of Lafontaine, now considered the best part of his works and still recited in French primary schools, completed his literary contributions, though he left unfinished a *Guillaume Tell* and an abridgment of *Don Quixote*. He died in Paris, Sept. 13, 1794. All his works (20 vols., Paris, 1824) are delicately sentimental, turning to idyllic artificiality the nature cult of Rousseau. Consult: Montvaillant, *Florian, sa vie, ses œuvres, sa correspondance* (Paris, 1879); Claretie, "Florian," in the *Classiques populaires* (Paris, 1888); W. Schwenke, *Florians Beziehungen zur deutschen Litteratur* (Leipzig, 1909).

FLO'RIAN (Lat. *Florianus*), SAINT (?-c.303). The patron saint of Upper Austria. It is said that he was born in what is now Austria, served in the Roman army, and was thrown into the Enns, weighted with a stone, and drowned during the Diocletian persecution, about 303. He was buried on the site of the Augustinian monastery of St. Florian, 8 miles southeast of Linz. An untrustworthy tradition says that the remains were afterward taken to Rome and in 1183 were transferred to Cracow. He is often represented as pouring flames from a vessel, and is invoked for protection against fire. His day is May 4.

FLORIANOPOLIS (formerly Desterro, Nossa Senhora do Desterro, or Santa Catharina). The capital of the State of Santa Catharina, Brazil, situated on the west coast of the island of the same name, 485 miles southwest of Rio de Janeiro (Map: South America, S., K 3). It has a picturesque site, being surrounded by hills, is regularly built, and contains a fine plaza, around which centre the principal buildings and a lyceum, an arsenal, and a hospital. An excellent harbor defended by fortifications has contributed to the city's commercial development, its principal exports being manioc flour, rice, coffee, sugar, fish, hides, earthenware, and artificial flowers. Pop., 1890, 30,687. Desterro was founded in 1640 by colonists from the Azores.

FLO'RIAN'S. The best-known café of Venice, on the Piazza San Marco. It has been a resort for Venetians and travelers for two centuries.

FLO'RICAN, or FLO'RIKIN. A genus of large game birds, nearly allied to the bustards, two species of which inhabit the open districts of India—the larger, or Bengal, florican (*Sypheotis bengalensis*), and the lesser (*Sypheotis*

aurita). They go about in small flocks, extremely shy, wary, and strong of flight, and in the winter offer excellent sport to the gunner and are highly prized as delicate food. Both species are mainly black, with crests and ear tufts, and with white markings on the wings; but the females and young of the Bengal species are mottled brown and white. Consult Baker, *Journal Bombay Natural History Society*, xxi (Bombay, 1912).

FLORICULTURE (from Lat. *flos*, flower + *cultura*, cultivation, from *colere*, to cultivate). The cultivation of plants for æsthetic purposes. In its widest sense floriculture embraces the growing of plants in windows, as well as in greenhouses and gardens, and some of its phases are closely linked on the one hand with arboriculture and on the other with landscape gardening (q.v.). In floriculture plants are grown for their individual effect, in landscape gardening for their effect in the landscape picture. From early times flower growing has been practiced in all civilized countries; but its development as a business of commercial importance, especially in America, is of comparatively recent date. Commercial floriculture in the United States is scarcely a century old; but its progress has been steady and during the last half of the nineteenth century was very rapid. In 1852 there was scarcely any capital invested in greenhouses and gardens, except for the pleasure of the owners; in 1909 there were 7444 commercial florists' establishments having an average of over 15,400 square feet of glass each, or a total of 114,655,000 square feet. The average yield value of these establishments was 30 cents per square foot, or a total of about \$34,400,000. The florist secures his greatest income from the production of cut flowers. Roses, carnations, chrysanthemums, violets, and lilies, in the order named, are the mainstay of this trade, although several million dollars' worth of miscellaneous flowers and plants in season are also grown. See articles on flowers mentioned above. Consult: Henderson, *Practical Floriculture* (New York, 1911); Hunt, *How to Grow Cut Flowers* (Terre Haute, 1893); Taft, *Greenhouse Management* (New York, 1898); Scott, *Florists' Manual* (Chicago, 1899); Bailey, *Standard Cyclopedia of Horticulture* (New York, 1914); Waterfield, *Flower Grouping in English, Scotch, and Irish Gardens* (ib., 1907); Wright, *Beautiful Flowers and How to Grow Them* (2 vols., ib., 1910).

FLORIDA (Sp., flowery, so called by Ponce de Léon, either from his discovery of it on Easter Sunday, Sp. *Pascua florida*, *Pascua de flores*, flower Easter, or, less probably, on account of the abundance of flowers which he saw). Known both as the "Everglade State" and as the "Peninsula State." The southernmost State of the American Union, situated between lat. 24° 30' and 31° N. and long. 79° 48' and 87° 38' W. It is bounded on the north by Alabama and Georgia, on the east by the Atlantic Ocean, on the south by the Strait of Florida and the Gulf of Mexico, and on the west by the Gulf of Mexico and Alabama, the extreme westward boundary being defined by the Perdido River. The greatest length from north to south is about 450 miles, and the extreme width of the northern or continental portion is nearly 400 miles. The peninsular extension has a length of 375 miles, with an average width of 95 miles. Florida ranks second in

size among the States east of the Mississippi River; its total area is 58,666 square miles, of which 3805 square miles are occupied by lakes, rivers, and ponds.

Geology. As Florida is wholly included in the coastal plain (which borders the Atlantic and Gulf coasts from Long Island to Mexico), its geological formations are all comparatively recent. It was once believed that the whole State was composed of alluvium. Louis Agassiz in 1852 advanced the theory that the peninsula was of coral origin; and this view, somewhat modified by Joseph Le Conte in 1857, was pretty generally accepted until 1881, when Eugene A. Smith demonstrated the Tertiary age of a large part of the peninsula.

No igneous or greatly metamorphosed rocks occur in or near Florida. The strata are all sedimentary and lie horizontally, as deposited, or with a gentle dip, distortions such as characterize mountainous regions being conspicuous by their absence. The foundation rock throughout the State is a massive limestone, and the deposits overlying it consist of limestones, sandstones, clays, and sands, derived mostly from sediments carried down from the higher land to the north and west.

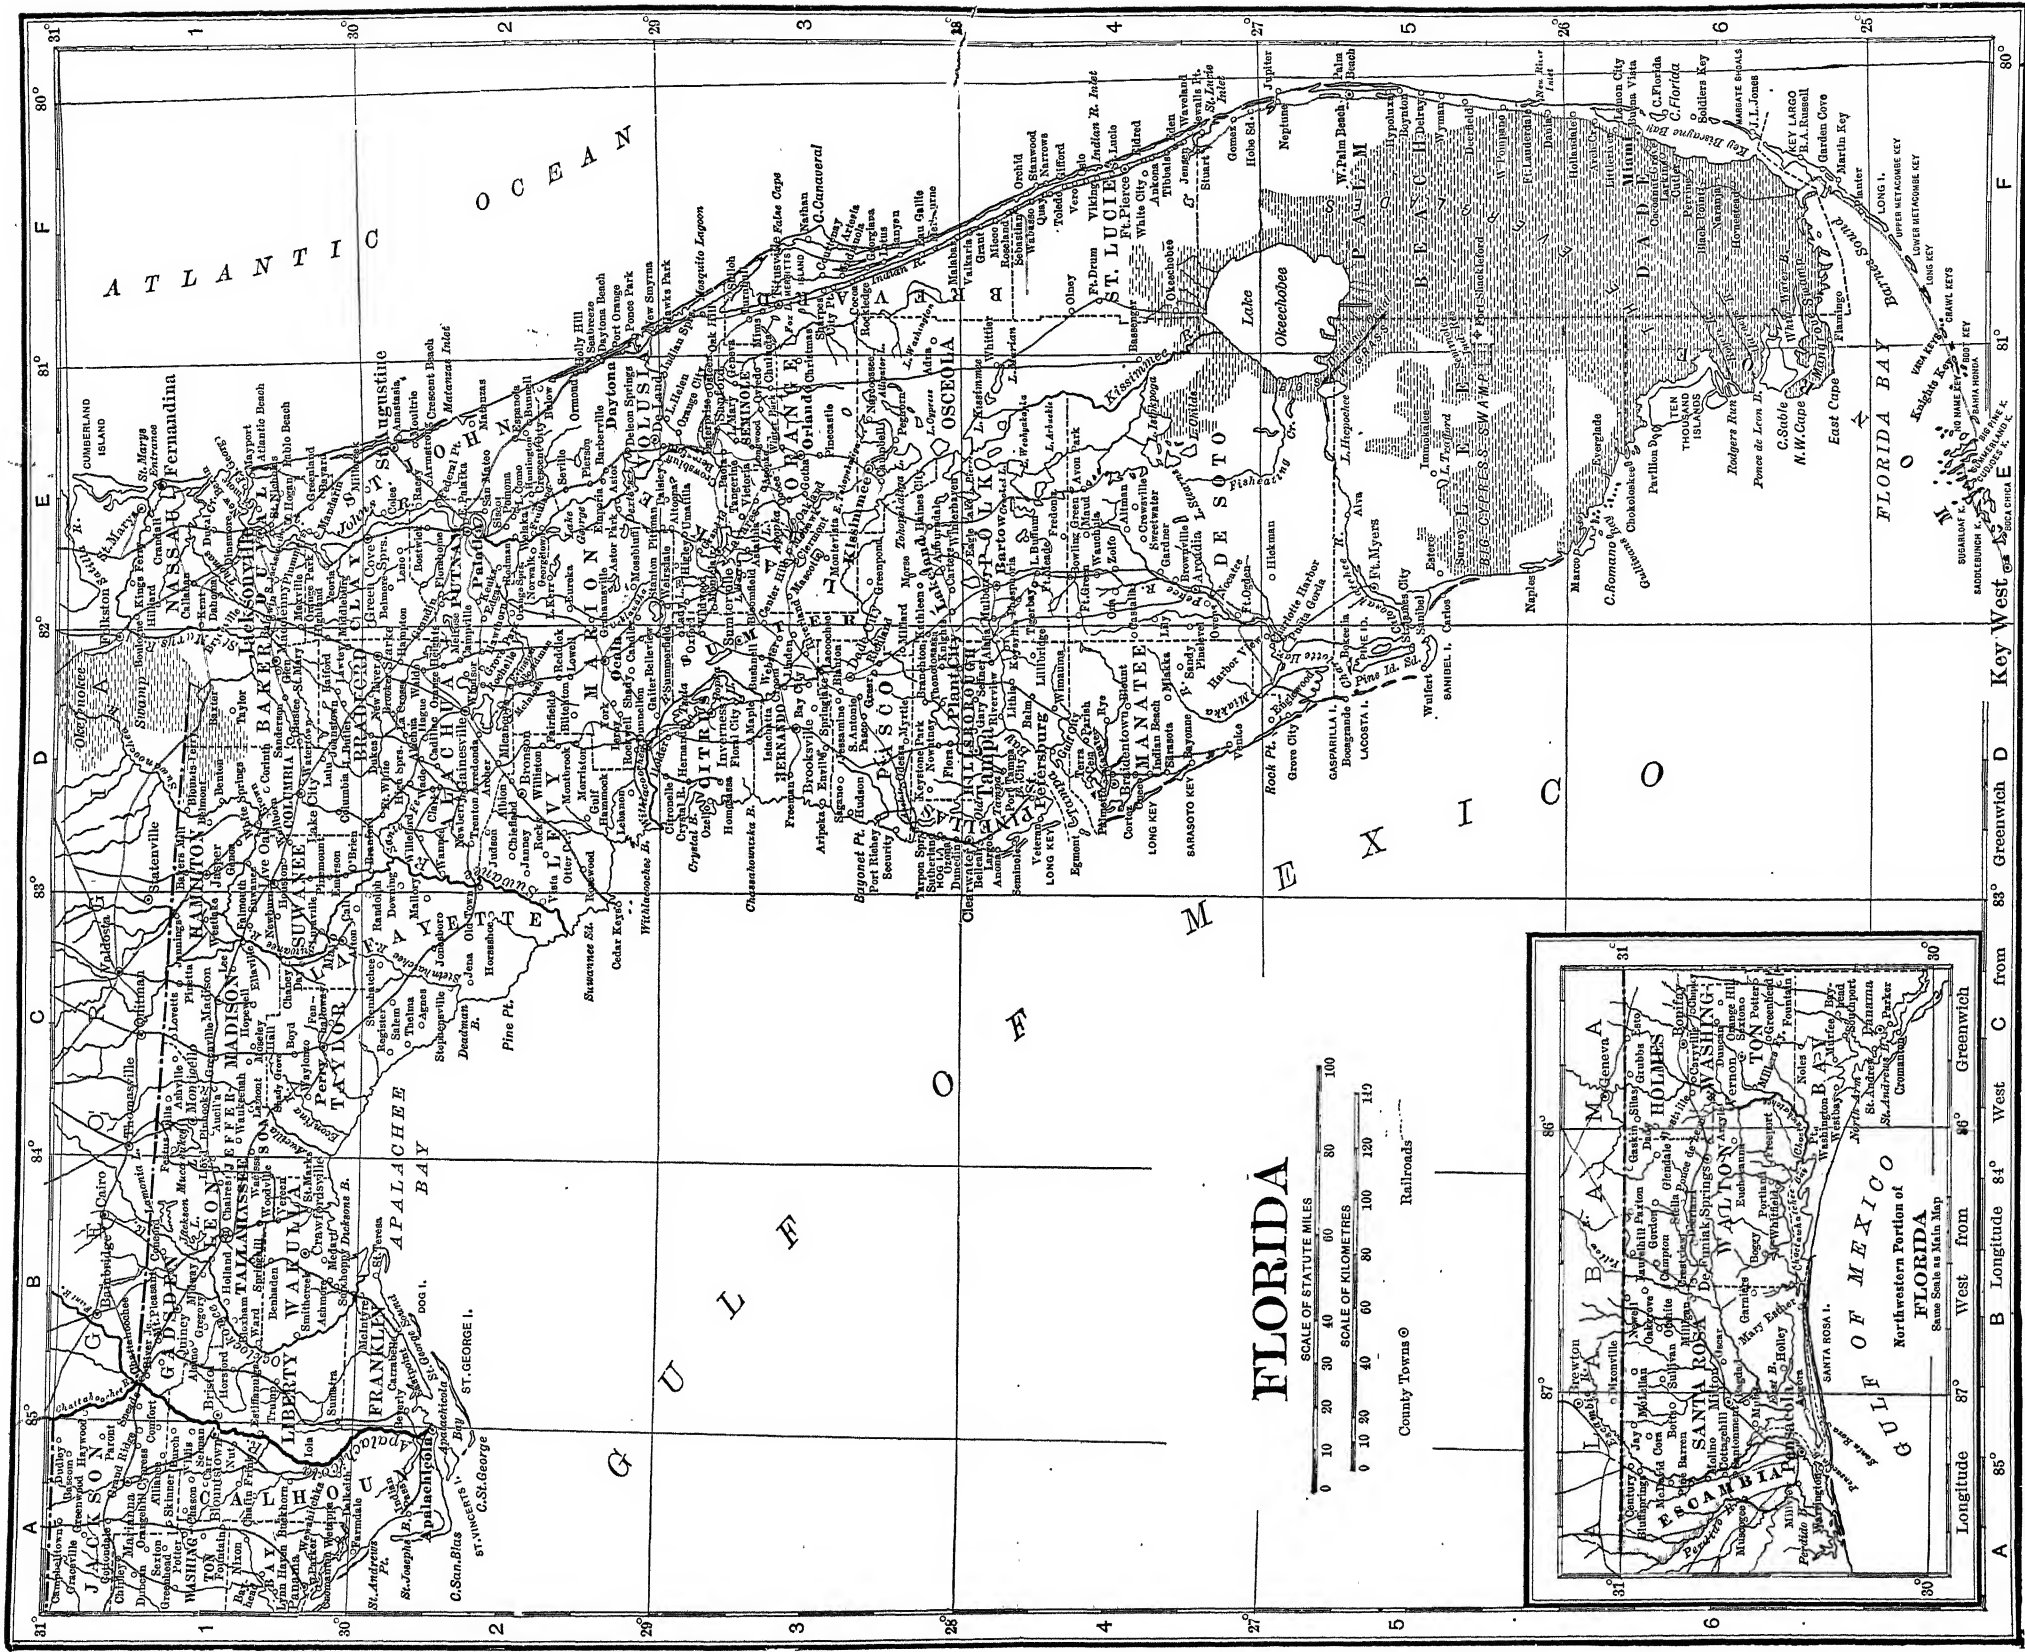

All the formations belong to the Cenozoic, the latest of the large divisions of geological time. They may be classified as follows, in descending order:

RECENT: Sand dunes, shell mounds, Indian remains, soils, etc.
PLEISTOCENE: Miami and Key West oolitic limestones; Key Largo coralline limestone; coquina and other shell deposits.
PLIOCENE: Caloosahatchee and Nashua marls; hard rock and land pebble phosphate deposits.
MIOCENE: Jacksonville limestone; Choctawhatchee marl.
OLIGOCENE: Alum Bluff, Chattahoochee, and Vicksburg formations.

The oldest formation certainly known in Florida, the Vicksburg limestone, belongs, as indicated in the table, to the Oligocene period, and was formerly classed as Eocene. It is several hundred feet thick and made up largely of the minute shells of foraminifera, although many larger shells and other fossils occur in it. The Chattahoochee and Alum Bluff formations, which immediately overlie the Vicksburg, are at or near the surface over much of the northwestern part of the State and are exposed along the Hillsborough and Manatee rivers in the southern part.

The Miocene formations are exposed at Alum Bluff on the Apalachicola River and evidently underlie a considerable area in that part of the State. They are found also near the east coast from Jacksonville southward. Marine shell marls of Pliocene age occur over much of the southern half of the peninsula and are best exposed along the Caloosahatchee River. Pleistocene deposits are well developed in the extreme south. The Miami oolite, which appears to underlie a considerable part of the Everglades (q.v.), is perhaps the most extensive of this group. The only strictly coralline formation is the Key Largo limestone, which forms the "upper" Keys, from Soldier Key to Bahia Honda.

Underground Waters. The chief sources of water supply in Florida are shallow or surface wells, deep or artesian wells, and springs. The shallow wells usually penetrate only the superficial sands and clays and furnish soft water. The deep wells penetrate the various formations previously named and furnish water free

from surface contamination, but in many cases somewhat hard or sulphurous. The purest artesian water is obtained in the extreme western part of the State, where the formations are essentially noncalcareous. The limestones farther east are usually more or less porous or cavernous and contain large amounts of water; and in wells that go down into the Vicksburg formation the supply appears to be inexhaustible. Water that flows without pumping is obtained in localities mostly within 100 feet of sea level, but not along the entire coast, on account of peculiarities in the dip of the strata. In 1911 nine springs reported sales of mineral water, aggregating 114,416 gallons, valued at \$19,330.

Soils. The soils of Florida are very diversified and adapted to a variety of crops. Those of the uplands, except in a few of the northern counties, are prevailingly sandy and were formerly regarded as of little value; but on account of being easily worked and "warm," they are very desirable for early truck crops. The limestones, marls, and clays are exposed at the surface in many places and cause significant variations in the soils. Hammock soils (see under *Vegetation*, below), which contain considerable humus, have always been regarded as the most productive. Considerable areas of muck or peat have been drained and cultivated with profit.

The copious warm summer rain in Florida, while it supplies crops with necessary moisture, making droughts almost unknown, and prevents the accumulation of alkalies and other deleterious substances, at the same time removes from the soil a large part of the compounds of calcium, phosphorus, and potassium. Florida soils are, as a rule, rather deficient in nitrogen and potassium, though about up to the average in calcium and phosphorus, as might be expected from the extensive deposits of limestone and phosphate rock.

Topography. The topography of Florida is considerably diversified, for a region with a maximum relief of only 300 feet. The greater part of the area north and west of the base line and meridian passing through Tallahassee is a sort of plateau, dissected by many swift streams, averaging perhaps 150 feet above sea level, and having some small areas between 250 and 300 feet; but there are many local variations not easily described in a few words. Escambia Bay, near Pensacola, is bordered by high bluffs, visible from the Gulf, and elevations of 100 feet or more are found within half a mile of the water there. Another area of considerable altitude is the lake region, which extends from a few miles east of Starke down the centre of the peninsula to De Soto County, with a length of about 200 miles and an average width of about 40. This is moderately hilly throughout, except along the St. John's and Ocklawaha rivers, and some of the hills in the southern part of Lake County are probably at least 250 feet above sea level, though no exact measurements are available. This region contains many lakes, as its name implies, but very few streams. There are high red-loam hills and a few lakes in the northern tier of counties between the Apalachicola and Suwannee rivers; and a narrow belt of high land, with some points exceeding 200 feet in elevation, extends through Citrus, Hernando, and Pasco counties, on the west side of the peninsula.

A peculiar type of topography characterizes

the lime-sink region, which extends from Hamilton County to Pasco County, west of the lake region. There the surface is everywhere undulating and dotted with innumerable shallow basins, from a fraction of an acre to several hundred acres in extent, only the larger of which hold water. The drainage is mostly through subterranean channels in limestone, and there are many areas 10 miles square on which there are no surface streams whatever. There are several caves and natural bridges in this and other limestone regions.

From St. Andrew's Bay eastward the country near the coast, and in some places as much as 40 miles inland, is mostly low and flat, except for a line of dunes along the east coast and low bluffs along some of the streams. The "flatwoods" areas ascend gradually towards the interior, but scarcely exceed 100 feet in elevation, except in Columbia and adjoining counties, where the inland edge of the northeastern flatwoods is about 200 feet above sea level (and higher than the country immediately southwest of it), and along Trail Ridge. This ridge extends from the north end of the lake region northward parallel to the coast some distance beyond the northern limits of the State, and its crest is over 200 feet above sea level in Florida (somewhat less in Georgia).

Streams and Springs. The Escambia, Choctawhatchee, Apalachicola, Ocklocknee, Suwanee, and several smaller rivers rise north of the borders of the State and flow into the Gulf of Mexico. Of these the Apalachicola is always, the Escambia and Choctawhatchee sometimes, and the others rarely or never, muddy. The streams confined to Florida are the St. John's, Withlacoochee, Peace, Kissimmee, and Caloosahatchee rivers and their tributaries, and a host of smaller independent systems. These are never muddy, and some of them, issuing from large limestone springs, are remarkably clear. They fluctuate very little, and floods are almost unknown in this State.

The Choctawhatchee and Apalachicola rivers are navigable for steamboats all the way across Florida, the Suwanee to Bradford or occasionally to Ellaville, the St. John's for over 200 miles, and the Ocklawaha and Caloosahatchee to the lakes at their heads. The Holmes, Chipola, St. Mark's, St. Mary's, and a few other of the smaller rivers are navigated for short distances, and logs are rafted down many still smaller streams.

Most of the rivers named have so little fall that water power has scarcely been reckoned among Florida's resources; but the Withlacoochee has recently been dammed a few miles from its mouth and made to furnish electric power for several phosphate mines in the vicinity. There is a similar but smaller development on the Hillsborough River near Tampa; and among the hills of West Florida several grist mills, etc., are run by water power.

Florida is noted for its large springs, most of which are in the limestone regions. The largest whose flow has been measured is Silver Spring, in Marion County, which discharges on the average 368,913 gallons a minute. It is about 200 feet in diameter and 30 feet deep, and steamers from the Ocklawaha River come right up into it. Wakulla Spring, at the head of the Wakulla River, in the county of the same name, is about 500 feet wide and 100 feet deep and is probably the largest spring in the world.

Lakes and Ponds. Lakes are very numerous in Florida, their number having been estimated at 30,000. They occur in nearly every county in the State, but the majority of them are in the lake region in the middle of the peninsula. They vary in size from Lake Okeechobee, over 1000 square miles, down to a few acres, and they contribute no small part to the charm of Florida's scenery. Most of those in the lake region are surrounded by hills and have sandy beaches and clear water. In the flatwoods regions and some other parts of the State shallow ponds full of cypress and other aquatic trees are very common.

Coast and Harbors. The coast of Florida is over 1000 miles long, without counting indentations. The Atlantic coast as far south as Biscayne Bay is bordered by narrow sandy beaches, behind which there is an almost continuous natural waterway. The missing links of this channel have recently been supplied by canals, so that boats drawing not more than four feet can now follow an inner passage all the way from Fernandina to Miami. There are very few inlets or harbors on this long straight stretch of coast. The smooth hard beach at Ormond has been a favorite place for automobile races. From Soldier Key, a few miles south of Miami, to Key West, a distance of about 135 miles, extend the Florida Keys, a chain of low rocky islands, mostly of coralline formation, now connected with the mainland by a railroad. The Gulf coast is low and swampy from the Keys to the Caloosahatchee River, thence bordered by sand bars as far as Tarpon Springs, flat and almost devoid of beaches or islands from there to the Ocklocknee River, then mostly of the barrier-beach type to the western limits of the State.

The principal harbors or seaports are Fernandina, Jacksonville, Miami, Key West, Fort Myers; Charlotte Harbor, with the ports of Boca Grande and Punta Gorda; Sarasota, Bradentown, and other settlements at the mouth of the Manatee River; St. Petersburg, Tampa, and Port Tampa, on Tampa Bay; Port Inglis, at the mouth of the Withlacoochee River; Cedar Keys, St. Marks, Carrabelle, Apalachicola; St. Joseph's Bay, with the new settlement of Port St. Joe on the site of a town that flourished and decayed in the first half of the nineteenth century; several settlements on St. Andrew's and Choctawhatchee bays; and Pensacola and other ports on Pensacola Bay and its tributaries.

Climate. The climate of Florida varies from warm-temperate to semitropical. The average temperature ranges from 66° F. at the extreme north to 77° F. at the extreme south, and the mean January temperature from 50° F. to 69° F. between the same geographical limits. The mean July temperature is nowhere less than 80° F. or more than 84° F. The temperatures for December and August are almost the same as for January and July. The average growing season (time between last killing frost in spring and first in fall) ranges from 260 days at the north to 365 at the south. Although many places in the southern half of the State claim to be "below the frost line," freezing temperatures occasionally extend almost to Key West, which is practically the only place in the State that is exempt. The lowest temperature ever recorded in the State was 2° F. below zero, at Tallahassee, on Feb. 13, 1899. The most memorable cold waves of the last twenty-five years

were those of December, 1894, February, 1895, February, 1899, and December, 1906. Vegetables and citrus fruits in the northern two-thirds of the State have been considerably damaged by cold at several other times. Snow falls in the northern half of the State only at intervals of several years and then to an insignificant depth. It is unknown in the southern half.

The annual rainfall varies considerably in different parts of the State and in different years. The highest average figure recorded is 65.49 inches at De Funiak Springs, in the northwestern part of the State. Molino, in the extreme western part, had 98 inches of rain in 1912, Tampa had 89 inches in 1840, Fort Pierce 96 inches in 1853, and Miami 85 inches in 1908. The lowest precipitation, 38.26 inches, is at Key West; and in 1893 there was only 22 inches of rain there. The southernmost keys, curiously enough, are almost the driest part of the eastern United States, which accounts for the occurrence there of several species of cacti which are unknown elsewhere. Miami ranks next to De Funiak Springs in precipitation, having an average annual rainfall of 63.75 inches.

Throughout Florida, as in many tropical countries, there is more rain in summer than in winter. The rainy season begins and ends a little earlier in the western parts than in the eastern, but in general it may be said to cover the four warmest months (June to September inclusive). The percentage of the total annual precipitation falling in these four months ranges from 37.9 at Flomaton (just over the line in Alabama) and 44.3 at De Funiak Springs to 62.1 at Brooksville and 63.7 at Fort Myers. For the six warmest months (May to October), the corresponding percentages are 49.9 at Flomaton, 55.8 at De Funiak Springs, 74.4 at Miami, and 76.8 at Fort Myers. The seasonal percentage figures for Key West are nearly the same as for Miami, notwithstanding the great difference between the two places in total annual rainfall.

The dryness of the winters is an important factor in making Florida an ideal winter resort, and the wetness of the summers must have an important influence on soil and vegetation. By far the greater part of the summer rain comes in the daytime, in the form of brief showers, which cool the air considerably.

On account of its nearness to the ocean the whole of Florida is continually swept by winds, but these are gentle except in late summer and early fall, when West Indian hurricanes are to be expected almost anywhere on the coast, averaging about one a year. These storms often do considerable damage, and they are almost the only disagreeable feature of Florida's climate.

Vegetation. In most parts of Florida the vegetation is the most conspicuous feature of the scenery. At least 90 per cent of the original forest area is still wooded, though the forests of course have been considerably thinned by lumbermen in the vicinity of rivers and railroads. The greater part of the State is covered with parklike open forests of long-leaf pine and related species. As a rule, the flatwoods areas have a dense low undergrowth of saw palmetto and other shrubs, while in the more elevated regions the forests are carpeted with wire grass and other herbs, and there are usually some small oaks mixed with the pines.

The Everglades (q.v.) are a vast saw-grass marsh extending from Lake Okeechobee almost

to the southern end of the State and covering about 5000 square miles. Other treeless areas, known as prairies, but differing from the Western prairies in being low and subject to occasional inundation in the rainy season, are widely distributed over the peninsula, diminishing in size and abundance northward.

On clayey soils in some of the northernmost counties are extensive areas of hardwood forests similar to those of adjoining States. Smaller oasis-like bodies of hardwood, known as hammocks (q.v.), are scattered among the pine forests of the peninsula. A type of vegetation peculiar to Florida is known as scrub. It is composed of Florida spruce pine (*Pinus clausa*) and a number of evergreen shrubs, with no grass and few herbs of any kind. It is most frequent in the lake region, but also occurs east and west of there. The soil of the scrub is usually a white quartz sand, of no value for agriculture, except south of lat. 28° on the east coast, where the winter climate is mild enough to permit the growing of pineapples.

Swamps of many kinds are found in all parts of the State, but are comparatively scarce in the lime-sink region and lake region. The estimates of the amount of swamp in Florida which are frequently published are considerably exaggerated, however, by the inclusion of the Everglades, which is not a swamp in the proper sense of the word, but a marsh or wet prairie. Limited areas of salt marsh occur along the coast northward, and in the extreme south these are replaced by mangrove swamps.

Flora. The flora of Florida, largely on account of its great extent in latitude ($6\frac{1}{2}^{\circ}$), is very rich. There are at least 200 species of native trees, without counting many small ones which are usually shrubs—which is a much larger number than are found in any other State. The shrubs and herbs bring the total vascular flora up to about 3000 species. The plants in the northern half of the State are much the same as in the long-leaf pine regions of Georgia and Alabama, while in the lake region and southward there are hundreds of species confined to Florida. The flora of the hammocks and keys of the two southernmost counties is almost wholly West Indian. Among the commonest native trees are seven or eight species of pine, two of cypress, 15 or 20 oaks, several bays, sweet gum, black gum, magnolia, hickory of several species, cabbage palmetto, red maple, and many others less familiar to the layman.

Fauna. The fauna of Florida is even richer than the flora. Of animals widely distributed in eastern North America, possums, coons, rabbits, squirrels, and buzzards are common, and bears, deer, otters, wild cats, and wild turkeys are still found in the regions remotest from civilization. Snakes are probably no more abundant than in any other eastern State of similar area.

Of animals peculiar to the southeastern States and most abundant in Florida the best known is the alligator, which is much less common now than formerly, however, owing to the depredations of hunters. The salamander and gopher (the former a rodent and the latter a turtle) abound in dry sandy pine forests, where they spend most of their lives underground. Egrets were once common, but have been ruthlessly slaughtered for their plumes, so that they are now almost confined to a few relatively in-

accessible places at the south end of the peninsula. Pelicans are frequent along the coast, but their breeding places are few in number. Smaller birds are too numerous to mention.

Of animals confined to Florida, or nearly so, the manatee, or sea cow, was formerly found along the southern coasts, but is now almost extinct. Crocodiles are occasionally seen in the extreme south. Sponges are gathered in the Gulf of Mexico near Carrabelle, Cedar Keys, Tarpon Springs, and Key West.

Mining. The only mineral product of great importance in the State is phosphate rock. This constitutes over 90 per cent of the value of the total mineral output. Although it was known as early as 1884 that valuable deposits of phosphate rock existed in the State, production on a commercial scale did not begin until 1889. The value of phosphate produced in Florida was in 1909 \$8,488,801 and now approximates \$10,000,000 annually. Formerly four kinds of phosphate rock were produced—hard rock, soft rock, land pebble, and river pebble. Soft rock has not been produced in recent years, and only an insignificant amount of river pebble is now mined. Hard rock is generally of higher grade than pebble and at one time was the only phosphate for which there was any demand for export. In recent years, however, the grade of land-pebble phosphate has been greatly improved by the methods of mining and treatment employed, and the export shipments from Florida now include not only practically all the hard rock produced, but also about one-third of the land pebble. In 1912 foreign shipments of phosphate rock from the State amounted to 1,203,005 long tons. This was about 700,000 tons more than the total production of hard rock. The difference represented the quantity of pebble exported and was a little more than one-third of the pebble production. In 1912 the total production of phosphate rock in the State was 2,406,899 long tons, valued at \$9,461,297, of which the combined production of land and river pebbles constituted 1,913,418 long tons, valued at \$6,168,129, while the output of hard rock was 493,481 long tons, valued at \$3,293,168. Florida is by far the leading State in the production of phosphate rock, the output representing over 80 per cent, both in quantity and value, of the total output in the United States. The production in 1913 was 2,584,794 long tons. The leading producing counties are Polk, Alachua, Citrus, Hillsborough, and Marion.

Florida is also the leading State in the production of fuller's earth, a variety of clay used chiefly for filtering and clarifying animal, mineral, and vegetable oils. The production of this mineral, while relatively large for that industry, is of minor importance when considered with the State's total mineral production. No figures of production in 1912 can be given on account of the fact that the information given to the United States Geological Survey by producers is confidential. The production in 1909 was valued at \$203,236 and in 1911 was 27,658 short tons, valued at \$265,571. Florida leads also in the production of ball clay, a very plastic clay used in giving plasticity to the body of high-grade pottery. The manufactured clay products of the State, valued in 1912 at \$272,766, were nearly all in brick. The manufacture of sand-lime brick is an industry of considerable importance, and in this the State ranks third. The value of this mineral

produced in 1912 was \$121,378. Other mineral products are lime, mineral waters, sand and gravel, and stone. The total value of all mineral products of Florida in 1909, as shown by the census return, was \$8,915,181 and in 1912 was estimated at \$10,272,594.

Agriculture. The low altitude of Florida governs its agricultural conditions. A large portion of the southern part of the State is at such a low elevation that it does not drain readily, with a result that large areas are swampy. The Everglades (q.v.) are occupied by deep, mucky soils, which rest usually upon the limestone of that section. North of the Everglades region occurs the flatwoods portion of the State, where the soils are prevalently dark-gray sandy loams, with many areas of muck. The extreme northern and northwestern portions consist of a more elevated and rolling portion of the coastal plain, where the soils are dominantly yellow and gray sands and sandy loams underlain either by yellow clay or red clay subsoil. Of the State's entire land area, only 15 per cent is in farms. In 32 counties the farm area is less than 20 per cent, while in the remaining counties the percentage is somewhat higher.

While the population of the State increased 42.4 per cent in the decade 1900-10, the number of farms increased but 22.5 per cent. During the same period there was an increase of 20.4 per cent in the total farm acreage and of 19.4 per cent in the acreage of improved land. The total number of all farms in the State in 1910 was 50,016, compared with 40,814 in 1900. Out of an approximate land area of 35,111,040 acres, the land in farms in 1910 amounted to 5,253,538 acres, and the improved land in farms was 1,805,408 acres. The average number of acres per farm in 1900 was 105, while in 1910 it was 106.9.

In 1910 the total value of all farm property including land, buildings, implements and machinery, domestic animals, poultry and bees, was \$143,183,183, compared with a value of \$53,929,064 in 1900, an increase of \$89,254,119, or 165.5 per cent in the decade. The average value of all property per farm rose from \$1321 to \$2863 in 1910, while the average value of land per acre increased from \$7.06 in 1900 to \$17.84 in 1910. Of the total number of all farms (50,016) in 1910, 36,674 were operated by owners and managers, while 13,342 were operated by tenants. In the three decades since 1880 the number of owners and managers combined has increased continuously from 16,198 to 36,674, or 126.4 per cent, and the number of tenants has increased from 7240 to 13,342, or 84.3 per cent. The tenants constitute 26.7 per cent of the total number of Florida farm operators. This is considerably lower than the average for the South Atlantic States as a whole, which is 45.9 per cent.

Of the owned farms in 1910, 29,614 were free from mortgage, while 5160 were mortgaged. The average debt per farm was \$652, and the average equity per farm was \$2446.

The acreage owned, operated, or leased by white farmers in the State in 1910 amounted to 4,484,833, while the acreage owned, managed, or leased by colored farmers amounted to 768,705. The improved land in farms owned, operated, or leased by white farmers in 1910 was 1,323,055 acres, while that owned, operated, or leased by colored farmers was 482,353 acres. The value of the

land and buildings on the farms owned by white farmers was \$106,230,421, while that owned by colored farmers amounted to \$11,915,568. Of the total number of farmers in the State in 1910 (50,016), 34,080 were native whites, while 14,721 were negroes and other nonwhites. The foreign-born white farmers numbered 1215. Of the native white farmers, 17.5 per cent were tenants, and of the foreign-born white, only 5.8 per cent were tenants. Among the nonwhite farmers the tenants constituted about half (49.7 per cent) of the total number.

The general characteristics of agriculture in the State are shown by the following table, giving the acreage, production, and value of the principal farm crops in 1909 and 1913. The figures for 1909 are from the thirteenth census, and those for 1913 are estimates from the United States Department of Agriculture.

		Acreage	Prod., bu.	Value
Corn.....	1913	675,000	10,125,000	\$8,302,000
	1909	605,771	7,023,767	5,709,000
Oats.....	1913	50,000	900,000	630,000
	1909	43,206	606,380	443,104
Rice.....	1913	400	10,000	6,000
	1909	623	12,341	15,290
Potatoes.....	1913	12,000	912,000	1,067,000
	1909	8,509	856,967	839,691
Sweet potatoes and yams.....	1913	21,000	2,310,000	1,717,000
	1909	21,995	2,083,665	1,231,238
Hay.....	1913	47,000	63,000*	1,147,000
	1909	54,729	55,300	847,485
Tobacco.....	1913	4,000	4,000,000†	781,000
	1909	3,897	3,505,801	1,025,476
Cotton.....	1913	218,000	52,000‡	\$3,980,000
	1909	263,454	65,056	4,841,581

* Tons. † Pounds. ‡ Bales of 500 pounds each.

It will be seen from this table that the leading crops given therein in the order of their importance are corn, cotton, sweet potatoes and yams, and tobacco. Peanuts, which do not appear in this table, were third in value in 1909, amounting to \$2,146,862. The production of tropical fruits, however, the statistics of which are given below, under *Horticulture*, is more important than any crop included in the table. Corn exceeds in acreage and value any other crop represented in the table, representing about 93 per cent of the total acreage and value of the cereals. The greater part of the remainder is contributed by oats. The acreage of cotton is about two-fifths that of the combined cereals, and its value more than three-fourths their value. The acreage peanuts in 1909 (126,150) with a value of \$2,146,862, was about one-fifth that of the cereals, and the value of the crop was approximately one-third as great. Corn has shown steadily increased production in recent years. Florida is one of the two southern States east of the Mississippi River which shows increases in the acreage of corn in the decade 1900-10. Wheat has also shown an appreciable increase in the decade, and the acreage of hay and forage has shown a rapid and steady increase since 1899. The production of cotton has increased considerably in the latest 10-year period. Cotton is grown almost entirely in the northern half of the State. Jackson County has more than one-sixth of the total cotton acreage. In the acreage and production of peanuts the leading county is also Jackson. About 88 per cent of the tobacco acreage is in Gadsden County. In 1909 there were grown 142,517 tons of sugar cane, from which were made 47,661 pounds of sugar and 2,533,096 gallons of sirup. The growing of vegetables is one of the most important agricultural industries of

the State. In 1900 the total acreage of potatoes and other vegetables was 88,104, and their value \$8,385,242. Excluding potatoes, and sweet potatoes and yams, the acreage was 57,600, and the value \$6,314,000, the acreage being more than twice as great and the value more than three times as great as in 1899.

Live Stock and Dairy Products. The total value of the live stock in 1910 was \$19,818,905. The cattle on the farms numbered 845,188, valued at \$9,262,262; horses, 45,640, valued at \$4,854,699; mules, 23,333, valued at \$3,545,821; swine, 810,069, valued at \$1,848,731; sheep, 113,701, valued at \$256,166. The number and value of live stock on Jan. 1, 1914, was estimated by the United States Department of Agriculture as follows: cattle, other than milch cows, 735,000, valued at \$10,070,000; milch cows, 128,000, valued at \$4,864,000; sheep, 118,000, valued at \$224,000; swine, 904,000, valued at \$5,424,000; horses, 55,000, valued at \$6,710,000; mules, 27,000, valued at \$4,536,000.

Horticulture. The most important fruits produced in Florida are tropical, and the growing of these forms the State's most important industrial activity. The most important are oranges, grapefruit, and pineapples. Orange culture became prominent in Florida about 1875, in the central section, and from that date rapidly grew in importance, although the industry was seriously hindered for several years by severe frosts. The winters of 1887, 1894, and 1899 were unusually severe, and this resulted in a serious setback in this industry. Disastrous frosts, however, are rare, and the industries rapidly recovered from their effects. Pineapples are grown along the east coast. Several of the west-coast counties have in recent years become prominent in the production of oranges. In addition to the fruits mentioned were grown lemons, limes, avocado pears, bananas, mangoes, Japanese persimmons, sapodillas, guavas, and figs. Other tropical products include coconuts. The total number of tropical fruit trees, vines, or plants of bearing age in 1910 was 39,761,368. The value of the fruits produced in 1909 was \$7,092,150, more than half this value being contributed by oranges and most of the remainder by pomeloes (grapefruit) and pineapples. The total value of tropical fruits increased from \$946,000 in 1899 to \$7,092,000 in 1909. In 1909, as noted above, the fruit crop suffered from a severe frost. The principal tropical fruit crops in 1911-12 with their value were as follows: oranges, 4,769,312 crates, valued at \$5,665,415; grapefruit, 1,405,308 crates, valued at \$2,684,525; pineapples, 355,658 crates, valued at \$383,155; lemons, 11,810 crates, valued at \$32,763; limes, 35,417 crates, valued at \$61,770; avocado pears, 19,373 crates, valued at \$53,730; bananas, 27,061 bunches, valued at \$18,633; mangoes, 26,559 crates, valued at \$26,346; Japanese persimmons, 4376 crates, valued at \$6053; sapodillas, 4051 crates, valued at \$5210; guavas, 56,172 crates, valued at \$49,281; figs, 16,534 crates, valued at \$25,555. The production of oranges, grapefruit, and limes in the State in 1912-13 was somewhat less than in 1911-12, although the orange crop was considered to be a full crop. The production of 1911-12 was above the average. The chief orange-producing counties in 1912 were Orange, Volusia, Brevard, Hillsborough, Putnam, Lake, DeSoto, and Polk. The counties in which the largest number of grapefruit are produced are Dade, Lee, Manatee,

Pinellas, Lake, Palm Beach, Orange, St. Lucie, and Brevard. The principal counties producing pineapples are St. Lucie, which produces by far the largest proportion, Dade, Palm Beach, and Lee.

The State also produces considerable quantities of orchard fruits, the total value of these in 1909 being \$232,203. The most important in point of value were peaches and nectarines, which were grown to the value of \$128,029. Pears in 1909 were valued at \$80,119, and plums and prunes at \$18,976. In 1911-12 the production of peaches was 178,566 bushels, valued at \$225,576; pears, 30,993 barrels, valued at \$78,258; plums, 17,716 bushels, valued at \$23,072. The grapes produced in the State in 1909 amounted to 1,086,344 pounds, valued at \$38,357. In 1911-12 the production of grapes was 1,054,945 pounds, valued at \$74,581. There were made in that year 20,354 gallons of wine, valued at \$19,968. The nuts produced in 1909 were valued at \$47,456, the most important of these being pecans. In 1911-12 there were produced of this nut 16,893 bushels, valued at \$94,887. There were produced, in 1911, 227,550 coconuts, valued at \$8441.

Strawberries are the only small fruit raised on a considerable scale. The production in 1909 amounted to 2,833,397 quarts, valued at \$301,056. The production in 1911-12 was 3,513,108 quarts, valued at \$482,845. The total value of fruit products of the State in 1911-12 was \$9,689,774.

Manufactures. Florida is not a manufacturing State, but its industrial activities have developed greatly in recent years. A number of navigable streams and the extensive coast line afford the manufacturing interests cheap transportation. All four of the cities having over 10,000 inhabitants—Jacksonville, Key West, Pensacola, and Tampa—have extensive docking facilities. Railroad transportation is good except in the Everglades region of southern Florida.

The growth of manufacturing is shown by the fact that in 1849 the industrial establishments numbered 103, with a product valued at \$668,335, while in 1909 there were 2159 establishments giving employment to an average of 57,473 wage earners, or 7.6 per cent of the total population. During this period the gross value of products per capita of the entire population of the State increased from \$8 to \$97. From 1849 to 1909 the proportion which the manufactures of the State represent of the total value of products of manufacturing industries in the United States increased more than fourfold. This proportion was less than $\frac{1}{10}$ of 1 per cent in 1849 and was nearly $\frac{1}{10}$ of 1 per cent in 1909. The accompanying table gives the most important figures relative to the principal manufactures in 1909 and 1904. The table includes only those industries the value of whose products in 1909 exceeded \$200,000.

It will be seen from the table that the most important industries are those connected with tobacco manufacture. There were 229 establishments engaged in these manufactures, employing 12,280 wage earners and producing products valued at \$21,575,000. These industries, which include chiefly manufactures of cigars and cigarettes, are confined largely to the southern portions of the State, particularly to Tampa and Key West, and it is the outgrowth of the immigration of Cubans to this section of the State.

A large part of the raw tobacco is imported from Cuba. The importance of the lumber and timber products is shown by the fact that it ranks second to tobacco in importance and ranks first in value added by manufacture. The value of the lumber and timber products in 1909 was \$20,863,000. This industry gives employment to the largest number of wage earners, 19,227

There are only four others, the value of whose product in 1909 exceeded \$1,000,000. These were printing and publishing, cars and general shop construction, bread and other bakery products, and the manufacture of ice.

The average number of persons engaged in manufactures during 1909 was 64,810, of whom 57,473 were wage earners. Of the wage earners

COMPARATIVE SUMMARY FOR 1909 AND 1904

ALL INDUSTRIES COMBINED AND SELECTED INDUSTRIES

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY		EXPRESSED IN THOUSANDS			
			Total	Wage earners (average number)	Capital	Wages	Value of products	Value added by manufacture
All industries.....	1909	2,159	64,810	57,473	\$65,291	\$22,982	\$72,890	\$46,762

	1904	406	17,282	15,541	2,939	3,714	9,902	9,177

in 1909. Third in rank are industries connected with the production of turpentine and rosin. In 1909 Florida produced 47.2 per cent of the total value of these commodities produced in the United States and occupied first place among the States in their production. They gave employment in 1909 to 18,143 wage earners, and the value of the product was \$11,938,000. For additional notes on the production of fertilizers, see the paragraph *Mining* above. The total value of the fertilizer products in 1909 was \$3,878,000. These are the leading industries.

over 16 years of age, 53,520 were male and 3012 female. The wage earners under 16 years of age numbered 941. Of the total number of wage earners employed, 53.5 per cent were in establishments where the prevailing hours of labor were from 54 to 60 hours per week and 15.9 in establishments where there were more than 60 a week.

The concentration of industries in the larger cities is shown by the fact that in 1909, with only 18.4 per cent of the total population of the State, cities having over 10,000 inhabitants

reported 41.6 per cent of the total value of manufactured products, and 25 per cent of the total average number of wage earners engaged in manufacturing. Tampa, although ranking second in population, is easily first when measured either by the average number of wage earners or by the value of products. There were in 1909 an average of 8996 wage earners, and the value of products in that year was \$17,653,021. The leading industry is the manufacture of cigars and cigarettes, the value of which amounted to \$14,557,329 in 1909. This city is the only one which showed an increase in the number of wage earners in the five-year period 1904-09. Key West showed decreases in the value of its products and the average number of wage earners, while Jacksonville and Pensacola showed decreases in the average number of wage earners. In Key West the manufacture of cigars and cigarettes is the leading industry, while in Jacksonville the leading industry measured by value of products is the manufacture of fertilizers. Pensacola, which has no single industry which contributes any great portion of its total value of products, except lumber manufactures, shows on the whole the greatest diversity of manufacturing industries.

Forest Products. A recent bulletin of the United States Bureau of Corporations (January, 1913) estimates the area of private timber holdings in Florida at 17,569,000 acres, or more than half the State; and the amount of standing timber at about 74,000,000,000 feet, board measure. Of this timber, pine is estimated to constitute 80 per cent, cypress 14½ per cent, and hardwoods 5½ per cent.

The thirteenth census reports 491 saw mills in the State, with the following production of lumber, laths, and shingles for the year 1909: pine (of several species, but mostly long-leaf), 1,110,840,000 feet; cypress, 84,811,000; hickory, 1,393,000; oak, 1,300,000; yellow poplar, 1,268,000; cedar, 1,261,000; cottonwood, 307,000; ash, 282,000; red gum (sweet gum), 260,000; tupelo gum, 7000; elm, 5000. Total, 1,201,734,000, valued at \$17,002,600. These figures do not include wood used for fuel, crossties, poles, posts, staves, veneers, etc., or other forest products like tanbark and naval stores (i.e., rosin and turpentine).

Florida is now the leading State in the production of naval stores (q.v.), which are obtained from the long-leaf and one or two other pines. The United States Census Bureau reports the 1910 production of turpentine at 14,900,000 gallons, worth \$9,454,000, and of rosin at 1,818,000 barrels, worth \$9,714,000; the figures for both of these commodities being a little more than half the total for the United States.

Fisheries. The fisheries of the State are of great importance. It is said that 600 species of fish are found in Florida waters, and many of these are not found elsewhere. Among the large specimens hunted for sport are the tarpon and kingfish. The value of the product for the year ending Dec. 31, 1908, the latest year for which complete statistics are available, was \$3,388,690. Of these the most important in value was mullet, of which 24,716,300 pounds, valued at \$652,030, were taken. Next in order of rank were sponges, of which 622,500 pounds, valued at \$544,880, were taken. Shad was caught to the amount of 2,836,200 pounds, valued at \$319,800; red snapper, 7,718,900 pounds, valued at \$434,060; Span-

ish mackerel, 2,647,400 pounds, valued at \$122,330; squeteague, or trout, 4,864,100 pounds, valued at \$196,350; prawns, 4,151,900 pounds, valued at \$84,280; terrapin and turtle, 183,700 pounds, valued at \$22,110. Oysters were taken to the amount of 1,066,800 bushels, valued at \$296,040. The alligator hides taken during the year numbered 50,900 and were valued at \$48,230. The total number of independent fishermen in the State was 3288, and the wage-earning fishermen numbered 5924. There were employed in fisheries 327 vessels, valued at \$618,674.

Transportation and Commerce. The State has exceptional facilities for water transportation and is also well provided with communication by land. The number of miles of main line of railroad in the State excluding second track and sidings, on June 30, 1913, was 4558, while the total mileage operated including all tracks was 5550. There are 39 miles of double track in the State. The railways having the longest mileage on Feb. 28, 1914, are the Atlantic Coast Line, 1527; the Seaboard Air Line, 978; the Florida East Coast, 637; the Louisville and Nashville, 245; the G. S. and F., 152; and the Apalachicola Northern, 102. The Florida East Coast Railway was completed to Key West on Jan. 22, 1912. Its construction over the Keys was one of the most remarkable engineering performances in the history of railroad building. The railroad forms a continuous route from Jacksonville to Key West, and for the last 100 miles of this distance is carried across keys and channels by means of embankments and viaducts. The general regulation of the railway rates is in the hands of the State Railroad Commission. The Federal government has made many important improvements in the harbors of the State. In 1911 work was begun on a channel, to be 30 feet deep and 300 feet wide, from Jacksonville to the ocean. Other improvements have been made in the St. John's River channel, at the channel in Apalachicola Bay, and in the channel at Pensacola. In the latter harbor a channel 30 feet deep and 500 feet wide has been completed from the Gulf to the city docks. An idea of the magnitude of the commerce of the ports of Florida is shown by the fact that in the calendar year 1913 there was a total tonnage of 850,089 entered in the foreign trade, while a tonnage of 606,749 was cleared in the foreign trade in the same period.

Education. Educational conditions in Florida have been far from satisfactory, but considerable improvement has been made in recent years. The same problem which confronts other Southern States which have a great preponderance of rural population and a large percentage of negroes is present. In 1910, 77,816 out of a total population of 10 years or over (564,722) were illiterate, or a percentage of 13.8. That conditions are improving is shown by the fact that in 1900 there were 84,285 illiterates, or 21.9 per cent. The percentage of illiteracy among whites of native parentage in 1910 was 5.2 per cent, and among whites of foreign or mixed parentage it was 9 per cent. Among the foreign-born whites it was 10.5 per cent. The percentage of illiteracy among the negroes was, in 1910, 25.5. This declined from 38.4 in 1900. Although the percentage of illiteracy is high, it is exceeded in five other Southern States. The school population of the State in 1910 was 243,917. Of these, 128,659, or 52.7 per cent, attended school during the year; thus nearly half

the school population in 1910 had no school attendance during that year. The native-white school population in 1910 was 124,330, and of these 74,638 attended schools. The native whites of foreign or mixed parentage in the school population was 12,942, of whom 7671 attended schools. The foreign-born white school population was 5318, and of these 1704 attended school. The negro school population was 101,285, of whom 44,634 attended school during the year. According to the report of the State Superintendent of Public Instruction, the approximate school population in 1913 was 256,418. The total enrollment in the public schools in the school years 1912-13 was 166,671, and the average daily attendance was 118,465. The teachers numbered 4532, of whom 1018 were male and 3514 female. The average salary of male teachers was \$67.47 per month, and of female teachers \$39.21 per month. The average length of the school term in 1912 was for white schools 114 days and for negro schools 97.

The total expenditure for education in 1911-12 was \$2,724,410. Of this sum, \$2,029,899 was expended for white schools and \$297,495 for negro schools. The total number of high schools in the State in 1912 was 83. Of these 25 were two-year schools, 10 three-year schools, and 48 four-year schools. The value of high-school buildings was \$1,305,550. The 83 high schools are located in 47 counties, and 3 counties of the State have no high schools. Provision was made by the Legislature of 1911 for the adoption of uniform textbooks throughout the State, and also for free textbooks to any child under 15 whose parents are on the roll of the county poor or are indigent or are dead. In 1905 all the State institutions for higher education were merged into the University of Florida (see FLORIDA, UNIVERSITY OF) at Gainesville, and the State College for Women at Tallahassee. Other institutions of higher learning include the John B. Stetson University at DeLand, the Southern College at Sutherland, and Rollins College at Winter Park. The last three are coeducational. There is also a Roman Catholic college, the St. Leo College and Abbey at St. Leo. Schools for negroes include the State Agricultural and Mechanical College for negroes at Tallahassee, the Cookman Institute, and the Boylan Industrial School and Home for Colored Boys at Jacksonville. Summer schools are held at Gainesville, Jacksonville, Lakeland, Madison, Marianna, Milton, Pensacola, Sutherland, and Tallahassee.

Finance. The report of the State Treasurer for the fiscal year ending Dec. 31, 1913, showed a balance at the beginning of the year of \$1,011,535. The receipts amounted to \$3,681,298, and the disbursements to \$3,224,999, leaving a balance on hand on Jan. 1, 1914, of \$1,467,833. The chief disbursements were for the executive department, for education, and for expenses of the government. The public debt of the State consists solely of refunded bonds amounting to \$601,567. These bear interest at the rate of 3 per cent per annum, and they are all held by the educational funds of the State. In 1912 a constitutional amendment was adopted empowering the Legislature to provide for special tax districts and to issue bonds for free public schools in these districts.

Banks. On June 14, 1912, there were in the State 46 national banks, with deposits subject to check amounting to \$19,962,471, and savings

deposits amounting to \$9,533,764. There were 143 State banks, with deposits subject to check amounting to \$17,297,867, and savings deposits of \$5,679,130. There were also in the State 3 stocks savings banks, with 35,854 depositors and deposits of \$1,213,195. The private banks numbered 7, with deposits of \$237,126, and the loan and trust companies 5, with deposits of \$495,001.

Charities and Corrections. The charitable and correctional institutions of the State include the State Institute for the Deaf, Dumb, and Blind at St. Augustine, the Florida Industrial School for Boys at Marianna, the Hospital for the Insane at Chattahoochee, and the Confederate Soldiers' and Sailors' Home at Jacksonville. The State follows the custom prevalent in other Southern States of employing its convicts at labor. Up to Dec. 31, 1913, the State prisoners able to labor were leased to the Florida Pine Company. The Legislature of 1913 passed a measure directing the Board of Commissioners of State Institutions to allot to the several counties such able-bodied male prisoners as might be desired for work on the public roads at a uniform rate of \$120 per annum per capita. Only 50 convicts were taken by the counties under this provision of the law. The remaining able-bodied male prisoners were then, in accordance with this act, leased to individuals and corporations throughout the State on competitive bids. The white male prisoners are leased at the rate of \$250 per annum per capita, and the colored male prisoners at the rate of \$283.15 per annum per capita. These leases are for two years only, expiring Dec. 31, 1915, whereas former leases were made for a period of four years, and all prisoners were leased to one lessee, who sublet them to turpentine operators throughout the State. Under the lease made in 1913 all able-bodied male prisoners except those engaged in county road work are worked on turpentine farms. The second-grade male prisoners and all female prisoners are excepted from lease by the Act of 1913. Those able to do any manual labor are employed at the State-prison farms at Raiford and Ocala. The Ocala farms contain something over 600 acres, and general farming is carried on. The Raiford farms contain 15,000 acres and in 1914 were being put in preparation for cultivation. In that year about 130 of the second-grade male prisoners were confined at Raiford and were engaged in the erection of buildings, the preparation of lands for cultivation, and other improvements. Unless the Legislature of 1915 should direct otherwise at the expiration of a two years' lease, all prisoners will be transferred to the prison farm at Raiford, and their employment will be along such lines as may be directed by the Legislature or the Board of Commissioners of State Institutions. Other acts relating to charities and corrections passed by the Legislature of 1913 were measures providing for the employment and compensation of county probation officers, and an act changing the name of the State Reformatory to the Florida Industrial School for Boys and forbidding the commitment of girls to that institution after Jan. 1, 1914. County judges in the State are required to act as judges of juvenile courts and to keep separate juvenile records.

Population. Following are the figures of population of the State by decades: 1830, 34,730; 1840, 54,477; 1850, 87,445; 1860, 140,424;

1870, 187,748; 1880, 269,493; 1890, 391,422; 1900, 528,542; 1910, 752,619. The estimated population in 1914 was 848,111. In 1910 Florida ranked thirty-third among the States in population, the same rank held in 1900. The per cent of increase in the decade 1900-10 was 42.4, compared with an increase of 35 per cent in the previous decade. The population per square mile in 1910 was 13.7. Of the total population, in 1910, 219,080 lived in places of a population of 2500 or more. This was an increase of 73.5 per cent in urban population in the decade 1900-10. The rural population in 1910 was 533,539, an increase of 32.6 per cent in the decade. The white population in 1910 numbered 443,634, and the negro population 308,669. The white population in 1900 numbered 297,333, and the colored population 230,730. Of the total white population in 1910, 373,967 were of native parentage, 35,825 were of foreign or mixed parentage, and 33,842 were of foreign-born parentage. By sex the population in 1910 was divided into 394,166 males and 358,453 females. The males of voting age numbered 214,195. The cities exceeding 10,000 inhabitants with their populations in 1900 and 1910 are as follows: Jacksonville, 1910, 57,699; 1900, 28,429; Tampa, 1910, 37,782; 1900, 15,839; Pensacola, 1910, 22,982, 1900, 17,747; Key West, 1910, 19,945, 1900, 17,114. Tallahassee, the capital, had in 1910 a population of 5018 and, in 1900, 2981. In addition to these cities there were 19 places with a population of 2500 and over in 1910.

Religion. About one-half of the church members of Florida belong to the Methodist church; more than two-thirds of the remainder are Baptists; other denominations represented are Catholic, Presbyterian, Protestant Episcopal, Disciples of Christ, Congregational, and Lutheran. Of these the Catholics are the strongest.

Indians. For hundreds of years the Seminole Indians of Florida have made their homes in the Everglades and have obtained a living by hunting, trapping, and fishing. In 1914 there were about 400 of these Indians who lived in camps surrounded by vast tracts of uninhabited swamps and morasses. They are the remnant of the band of the famous chief Osceola, whose savage forays upon settlers in the early history of the State resulted in a series of wars among the fiercest ever carried on by the United States government against Indians. On account of the various drainage projects now being undertaken for the reclamation of the Everglades, and the diminishing swamp area which has been their home and hunting ground, these Indians are rapidly being deprived of the game upon which they have heretofore subsisted. They are only in a limited sense agriculturists, but are natural hunters and trappers, making fully 75 per cent of their expenses of living from alligator skins. In addition to the restriction of their hunting grounds, during 1913 the tanneries discontinued the purchase of alligator skins. The Florida State Legislature in 1889 set aside 36 townships as a Seminole Reservation; but while the law apparently has not been repealed, nearly all the land has been obtained by private persons. A bill was introduced in the Legislature of 1911 to set aside 15 townships in Monroe County, but this failed to become a law. During the period from 1895 to 1900, 23,061 acres, with funds provided by Congress, were purchased for these Indians, and on Nov. 22, 1897,

there were withdrawn for them approximately 480 acres. Congress appropriated \$10,000 for the relief of these Indians in 1913, and a special commissioner was appointed to look after their interests. All efforts for their education on the part of the State and Federal government and missions have been unsuccessful because of the severe penalty inflicted by the tribal laws on any Seminole who learns to read and write. They are splendid types of the physical man and are nearer the aboriginal Indian in habits and customs than almost any other band in existence.

Militia. The militia of the State consists of the first and second infantry and one detachment of sanitary troops. The total strength of enlisted men on Jan. 1, 1913, was 1127, and of officers 93. The designation is the National Guard of Florida.

Government. The present constitution of the State was adopted by a constitutional convention held in 1885, was ratified by the people on Nov. 2, 1886, and went into effect on Jan. 1, 1887. The instrument has since been amended, but in no important detail. Either branch of the Legislature at a regular session may propose amendments to the constitution, and if these are agreed to by three-fifths of all the members elected to each House, the proposed amendment is voted upon by the people at the next general election. The Legislature by a vote of two-thirds of all the members of both houses has the power to determine whether a revision of the constitution shall be submitted to the electors. If a majority of the electors voting are in favor of a revision the Legislature must provide by law for a convention to revise the constitution to be held within six months after the passage of the law. The convention shall consist of a number equal to the membership of the House of Representatives and is apportioned among the several counties in the same manner as members of each House.

Legislative.—The Legislature of the State consists of a Senate and House of Representatives. Sessions of the Legislature are held biennially, beginning on the first Tuesday after the first Monday in April. The Governor may convene the Legislature in extra session by proclamation. Regular sessions of the Legislature may extend to 60 days, but no special session convened by the Governor may exceed 20 days. The Senate consists of not more than 32 members, and the House of Representatives of not more than 68 members. The members of the House of Representatives are elected for terms of two years, and the members of the Senate for terms of four years.

Executive.—The supreme executive power of the State is vested in the Governor, who holds office for four years and is not eligible for reelection for the next succeeding term. The other executive officers of the State include the Secretary of State, Attorney-General, Comptroller, Treasurer, Superintendent of Public Instruction, and Commissioner of Agriculture. These are elected at the same time as the Governor and hold office for the same term. The Governor is a member of the Board of Pardons, of which the other executive officers are also members, with the exception of the State Superintendent of Public Instruction. The Governor, Secretary of State, Attorney-General, Comptroller, Treasurer, Superintendent of Public Instruction, and Commissioner of Agriculture

comprise a Board of Commissioners of State Institutions. The Governor is also a member of the Board of Education. The salary of the Governor is \$3500 a year.

Judiciary.—The judicial power of the State is vested in a supreme court, circuit courts, criminal courts, county courts, county judges, and justices of the peace. The supreme court consists of five justices, elected for a term of six years. The chief justice is designated by lot. A majority of justices of the supreme court constitute a quorum for the transaction of all business. There are nine justices of the circuit courts, appointed, for a term of six years, by the Governor, subject to confirmation by the Senate. The circuit courts have exclusive original jurisdiction in all cases of equity, and they have final appellate jurisdiction in all civil and criminal cases arising in the county court. County judges have original jurisdiction in all cases of law in which the value of property involved does not exceed \$100. In counties where there is no county court justices of the peace have jurisdiction in such cases. The term of the judges of the county courts is four years.

Suffrage and Elections.—Qualified electors include every male person of the age of 21 and over who shall at the time of registration be a citizen of the United States and shall have resided in the State for one year and in the county for six months. Payment of poll taxes for the two years preceding an election (for one year in the case of persons who have been resident in the State for only a year) is a qualification for voting. General elections are held on the Tuesday next succeeding the first Monday in November, dating from 1906, and biennially on the same day thereafter. Voting is by secret official ballot. To conform with the Seventeenth Amendment of the Federal Constitution, the Legislature of 1913 passed a measure providing for the election of senators at the general election held next preceding the expiration of the terms of office of the senators. In the event of a vacancy in the Senate the Governor shall issue writs of election to fill the vacancy at the next general election, and he may make temporary appointments until the vacancy is filled by such an election.

The primary election law, enacted in 1913, provided for the nomination of all candidates for all elective, State, congressional, and county offices, for the United States Senate, and for the election of members of the State, congressional, and county executive committees. Any political party which, at the general election for State and county officers next preceding a primary, has polled more than 5 per cent of the entire vote cast in the State, is declared to be a political party within the meaning of the primary law and may nominate all candidates provided for in this law. The State Executive Committee of any particular party may, by resolution, declare for the nomination of candidates for other than elective offices and also for the selection of national committeemen, delegates to the national political conventions, and for president and vice president. Candidates are allowed to file sworn statements in support of their candidacy or in relation to the candidacy of other persons. The names of all candidates for the same office are printed on the ballot in alphabetical order. Provision is made for first and second choice in voting for candidates for nominations. Other measures passed at the

1913 session of the Legislature regulate campaign expenditures and provide penalties for corrupt practices in elections.

Local and Municipal Government.—The political unit of the State is the county. Five commissioners are elected for each county. Their term of office is two years. For each county the officers are a clerk of the circuit court, a sheriff, constables, the county assessor of taxes, tax collector, treasurer, superintendent of public instruction, and a county surveyor. The Legislature has power to establish and abolish municipalities, to provide for their government, to prescribe their jurisdiction and powers, and to alter or amend the same at any time. Towns and cities have the privilege of establishing a commission form of government, and at the end of 1913 the cities of Orlando, Pensacola, St. Petersburg, Pass-a-Grille, Green Cove Springs, and Tampa had adopted this form of government. The board of county commissioners of each county in the State, not oftener than once every two years, may, upon the application of one-fourth of the registered voters of any county, call an election to decide whether the sale of intoxicating liquors shall be prohibited. At the end of 1913 the cities of Gainesville, Lake City, Tallahassee, and Miami were "no license." On that date there were said to be only 355 saloons left in the State, and these were located in villages and towns. There were no saloons in rural districts.

Other Constitutional and Statutory Provisions.—A homestead to an extent of 160 acres of land or half an acre within the limits of any incorporated city or town owned by the head of a family residing in the State, together with 1000 dollars' worth of personal property and the improvements on the real estate, is exempt from forced sale under process of any court. All property, real or personal, of a wife, owned by her before marriage or lawfully acquired by her afterward, is her separate property, and she is not liable for the debts of her husband. There is a pure-food law, and laws for the suppression of contagious diseases in live stock. The Legislature of 1911 passed a measure providing that no verdict in the courts shall be set aside, or new trial granted, or judgment reversed, unless it shall affirmatively appear from the record that injustice has been done by the irregularity which was made the basis for assignment of error.

History. Florida was discovered on Easter Sunday (*Pascua Florida*), 1513, by Ponce de Léon, who landed near the site of the present St. Augustine in search of the Fountain of Perpetual Youth. He failed to find the fountain and, returning in 1521, found death instead. Ayllon carried off large numbers of Indians from Florida as slaves between 1520 and 1526, and in 1528 Pánfilo Narváez (q.v.) invaded the country with a force of 400 men eager for conquest and booty. Narváez pushed into the wilderness north of the Gulf, and only four survivors of his band, among them Cabeza de Vaca, succeeded in reaching Mexico after infinite hardships. In 1539 Hernando De Soto (q.v.) traversed the country. In 1559 a well-equipped expedition of 1500 men under Don Tristan de Luna sailed from Vera Cruz and landed, August 14, on the shores of Santa Maria Bay, probably the Bay of Pensacola. The main body penetrated into the country for a distance of 40 days' march, while a smaller detachment explored the region as far

as the Coosa River in eastern Alabama. Discouraged by the hardships encountered, the expedition returned to Mexico, after passing more than a year in the country.

Under the patronage of Coligny French Huguenots, led by Ribault, had founded in 1562 a colony at Port Royal in South Carolina; when that settlement, owing to the worthless character of the colonists, failed, René de Laudonnière brought over a new band of emigrants in 1564 and built Fort Caroline on the St. John's River. To uphold the Spanish claims to the country against the French, Pedro Menéndez de Avilés sailed from Spain in 1565, erected a fort at St. Augustine, and, taking Fort Caroline, exterminated the Huguenot colony. (See GOURGUES, DOMINIQUE DE.) St. Augustine was burned by Sir Francis Drake in 1586 and was plundered by English buccaneers in 1665; but the Spaniards retained their hold on the country and about 1699 founded Pensacola. In 1702 the Perdido River was made the boundary between Florida and French Louisiana. Between the Spaniards of St. Augustine and the southern English colonists hostile relations generally prevailed. A force from Carolina, under Colonel Daniel, burned St. Augustine in 1702, and in the following year Governor Moore, with a force of English and Creek Indians, defeated a Spanish force under Don Juan Mexia at Fort San Luis, near Tallahassee, and reduced a number of Spanish-Indian towns. In 1718 and again in 1719 Pensacola was taken by the French, the town being destroyed on the second occasion. When Georgia was settled, General Oglethorpe found it necessary to protect the new colony by an invasion of the enemy's country. He failed to take St. Augustine, but repelled an attack of the Spanish fleet on the forts of the Altamaha in 1742. By the Treaty of Paris in 1763 Spain ceded East and West Florida (the latter lay west of the Apalachicola River, and embraced a large part of what is now Alabama and Mississippi) to England, but recovered possession of both in 1783. West Florida was sold to France in 1795. After 1803 the United States asserted its title to the region between the Pearl River and the Perdido on the ground that it had formed part of Louisiana as held by France, Spain, and France again, in turn. In 1812 and 1813 United States troops took possession of the disputed territory. Pensacola was garrisoned by the British in 1814 with the consent of the Spanish authorities, but was taken by General Jackson in November of that year.

In East Florida Spain made no attempt to preserve order, and the country was overrun by white adventurers, Seminole Indians, and escaped slaves from the Southern States. Marauding bands of Indians and negroes crossed the frontier into Georgia, plundered and burned, and fled into Spanish territory beyond the reach of the United States authorities. Such reasons, as well as a natural hunger for land, made the Georgians anxious for the acquisition of the peninsula. In 1818 General Jackson, conducting operations against the Seminoles, invaded Florida and, after defeating the Indians, turned about and took Pensacola, the Governor of which had been supplying the Seminoles with arms. The town was restored to Spain; but in 1821 Florida, by virtue of a treaty concluded in 1819, passed to the United States, and in March, 1822, it was organized into a Territory. It was admitted into the Union in 1845. Between 1835

and 1843 a bitter warfare was waged against the Seminoles, and it resulted in the removal of the greater part of them beyond the Mississippi. On Jan. 10, 1861, the State passed an ordinance of secession. Three days previously the State authorities had seized Fort Marion and the arsenals at St. Augustine and Apalachicola; and on the 12th the navy yards and forts at Pensacola were taken possession of. Jacksonville, Fernandina, and St. Augustine were taken by the Federal forces in 1862; but at the battle of Olustee, Feb. 20, 1864, the State was lost to the Union. The ordinance of secession was repealed in October, 1865, and a State government was organized in 1866; but it was not till June, 1868, after a new constitution had been adopted and the Fourteenth Amendment ratified, that Florida was readmitted into the Union. For a number of years after the war the State was in difficult financial conditions, and the burden of taxation was heavy. Elaborate plans for the building of new railroads failed to be carried out, and many old roads went into bankruptcy. Between 1875 and 1880, a period during which the political power was passing from the Republicans to the Democrats, election contests were close and bitter, and appeals from the ballot box to the courts were frequent. The part played by the electoral vote of Florida in the disputed presidential election of 1876 was important. (See ELECTORAL COMMISSION.) After 1882 the reclamation of swamp lands in the south of the peninsula was carried on on a large scale and led to the development of the sugar industry. The discovery of rich phosphate deposits in 1889 improved economic conditions greatly, as has the growing popularity of the eastern coast as a winter resort.

On Dec. 23, 1907, Stephen R. Mallory, United States Senator, whose term expired March 4, 1909, died, and on December 26 Governor Broward appointed William James Bryan to fill the unexpired term. Mr. Bryan died on March 21, 1909, and William Hall Milton was appointed to serve until the election of his successor.

In the Democratic primary elections of 1908 Duncan U. Fletcher secured the nomination for the senatorship, and Albert W. Gilchrist was nominated for Governor. The prohibition issue figured in the election, and Mr. Gilchrist was the candidate for the local-option wing of the party. In the national election held on Nov. 3, 1908, Bryan received 31,104 votes; Taft, 9923; Debs, Socialist, 3747. For Governor, Gilchrist, Democrat, received 33,036 votes, and Cheney, Republican, 6453. The Legislature of 1909 passed a bill providing for the submission at the general election in November, 1910, of an amendment to the constitution providing for State-wide prohibition. The amendment failed of ratification by the electors. An attempt to amend the constitution, by the adoption of a suffrage amendment known as the Beard Disfranchisement Resolution, designed to eliminate the negro vote, was defeated in the House of Representatives after it passed the Senate. The term of Senator Taliaferro expired on March 4, 1911, and primary elections for his successor were held on May 9, 1910. As none of the three contestants, Senator Taliaferro, N. B. Broward, and Claude L'Engle, received a majority of the votes, it was necessary under the Florida law as it then stood to hold a second primary on June 7, which resulted in the election of Mr.

Broward. The latter died, however, before he could take his place in the Senate. On this account it was necessary to hold another primary election for Senator on Jan. 10, 1911. There were three candidates, W. A. Blount, John N. C. Stockton, and Nathan P. Bryan, and as no one received a majority still another election was appointed for January 31. In this election Mr. Bryan was successful. On April 17, 1911, the income-tax amendment to the constitution was ratified by the Lower House, but failed of passage in the Senate. Primary elections were held by the Democrats on April 30, 1912, for the nomination of State officers, a representative to Congress, and delegates to the National Convention. A majority of votes were cast for delegates favorable to Oscar W. Underwood for President. Park Trammell was nominated for Governor. The Republicans of the State made their nominations in convention, nominating William R. O'Neal for Governor. The vote for President on Nov. 5, 1912, was as follows: Wilson, 36,416; Taft, 4279; Roosevelt, 4533; and Debs, 4806. For Governor, Mr. Trammell received 38,977 votes and Mr. O'Neal, 2046. The Progressive candidate for Governor, W. C. Hodges, received 2314 votes, and Cox, Socialist, 3467. In a primary election held on June 8, 1914, Senator Fletcher was renominated. This, in Florida, is equivalent to reelection.

In politics, both State and national, Florida since 1876 has been invariably Democratic. The State has four representatives in Congress, by the apportionment of 1910.

TERRITORIAL GOVERNORS

Andrew Jackson.....	1821-22
William P. Duval.....	1822-34
John H. Eaton.....	1834-36

FLORIDA. The first of the Confederate privateering vessels, built at Liverpool by Laird, a member of Parliament. She sailed from Liverpool in March, 1862, under the name of the *Oreto*; was equipped at Nassau, Bahamas, with an armament of two seven-inch and six six-inch guns, and in September ran the blockade into Mobile Harbor. On Jan. 6, 1863, she ran out as the *Florida*. In the Brazilian port of Bahia she was captured by the *Wachusett*, under Capt. Napoleon Collins (Oct. 7, 1864). Her seizure was a violation of the neutrality laws and gave rise to much excitement. The *Florida* was taken to Hampton Roads, where she was sunk not long after.

FLORIDA, CAPE. See CAPE FLORIDA.

FLORIDA, GULF OF. See FLORIDA STRAITS.

FLORIDA, UNIVERSITY OF. A State institution for the higher education of men at Gainesville, Fla. It was established in 1905, when all State institutions were merged by the Legislature of that year into the State University of Gainesville and the State College for Women at Tallahassee. The university is organized into the following departments: Graduate School; College of Arts and Sciences; College of Agriculture; College of Engineering; College of Law; Teachers' College; Agricultural Experiment Station and University Extension Division. Each division is presided over by its own dean or director and is governed by dean and separate faculty, and the major work of each division is carried on in its own separate and distinct building. There were 63 members of the faculty in 1914. The university has a total income of a little over \$100,000 per year for current expenses. The enrollment in 1914 was 489, including the Summer School with 348 in attendance during the regular session. The president in 1914 was A. A. Murphree, LL.D.

FLORIDA-BLANCA, flô-rê-bâ blân'ka, JOSÉ MOÑINO Y REMONDO, COUNT OF (1728-1808). A Spanish statesman. He was born in Murcia, was educated for the law at Salamanca, and became the principal prosecuting official to the Council of Castile. In this capacity he was the author of the decree for the expulsion of the Jesuits in 1767, and in 1772 he was sent by the Marquis Esquilache, the Prime Minister, on a mission to Rome to confer with Pope Clement XIV, and was created Count of Florida-Blanca on his return to Spain. In 1777 he succeeded Grimaldi as Minister of Foreign Affairs and also became president of the Council of Ministers. Florida-Blanca's long ministerial career, lasting from 1777 to 1792, was one of the most brilliant and successful in Spanish history. In foreign affairs his administration, although not so completely successful, was marked by true states-

manship. He is said by some writers to have suggested the famous "Armed Neutrality" (q.v.) in 1780, and it was during his administration of the Foreign Office that Spain joined with France, in accordance with the provisions of the Family Compact of 1761, in the war against England, though Florida-Blanca steadfastly opposed any recognition of American independence. A treaty was negotiated with the Sultan of Turkey, and Algiers bombarded, and the Algerine pirates were brought to terms. On the accession of Charles IV, in December, 1788, Florida-Blanca sought to retire from his position, but at the urgent request of the King retained his office three years longer, in which time the King rewarded him with the Order of the Golden Fleece. In 1792 an intrigue at court resulted in his retirement and the elevation of Aranda. Absurd and unsubstantiated charges of the malversation of funds were brought against him, and he was imprisoned for a short time in the fortress of Pamplona. On the fall of Aranda and the appointment of Godoy as Prime Minister, he was set at liberty, and restored to his rank and honors, after which he retired to his estates in Murcia. There he remained quietly until the Napoleonic invasion of 1808, when he was chosen President of the Central Junta of the government, but died soon afterward. His works have been edited with a good biographical introduction (dated 1867) by A. Ferrer del Río: *Obras originales del Conde de Floridablanca*, in the "Biblioteca de Autores Españoles," vol. lix.

FLORIDA JAY. See JAY.

FLORIDA REEFS or KEYS. See FLORIDA.

FLORIDA STRAITS (also called the New Bahama Channel, and the Gulf of Florida). The coast waters separating southeast Florida and the Florida Keys from the Bahamas and Cuba and traversed by the Gulf Stream (Map: United States, E., K 6). The total length of the straits is over 300 miles, and the width varies from 60 to 100 miles. The depth of the main channel varies from 3000 to 6000 feet, but the eastern half of the straits includes the shallow waters of the Great Bahama Bank.

FLORIDEÆ, flō-rīd'ē-ē. The greatest group of Red Algae, so nearly including all of them that it is used often for Red Algae in general. See ALGÆ.

FLORIDIA, flō-rē'dē-ā. A city of Syracuse, Sicily, on the Ciani, 7 miles west of Syracuse, in a fertile country, with vineyards, olive groves, and fields of grain. Pop., 1901, 12,165; 1911, 12,522.

FLORIDSDORF, flō'rēdz-dōrf. A suburban municipality, 3 miles north of Vienna, the capital of a district of the same name (Map: Austria, C 4). It is an important industrial centre, has railway shops, locomotive works; manufactures sewing machines, vehicles, screws, chemicals, oleomargarine, parquetry work, twine, bagging, rubber goods, and pottery. It also has large breweries and distilleries. Floridsdorf was a town of 6000 inhabitants prior to 1896, when it was made the government seat of a district and its municipal area extended to embrace several adjacent villages. Pop., 1900, 36,599; 1910, 38,727.

FLORIGRAPHY. See FLOWERS, LANGUAGE OF.

FLORIKIN. See FLORICAN.

FLORIN (OF., Fr. *florin*, from It. *florino*, from *fiore*, Lat. *flos*, flower; associated by popular etymology with It. *Fiorenza*, Florence, from

Lat. *florere*, to bloom, from *flos*, flower). The name of a gold coin first struck in Florence (q.v.) in the thirteenth century. It was of the size of a ducat and had on the obverse a lily and on the reverse the head of St. John the Baptist. These coins were soon imitated all over Europe. It was out of them that the German gold guildens of the Middle Ages and the modern silver guildens arose. These last were to the end marked by the letters *Fl*. The gulden, or florin, was once the unit of account in Austria, and the name is given to a silver two-kronen piece having a value of \$0.4052. Till 1875 a florin, or gulden, of \$0.35 was the unit in the South German states. The Dutch florin, or guilder, is also a silver piece and is worth \$0.4019. The English two-shilling piece, called a florin, is worth \$0.4866.

FLORINDA. In the legendary account of the conquest of Spain by the Arabs, the daughter of Count Julian, Governor of Andalusia, seduced by Roderic, last of the Gothic kings of Spain. In revenge her father invited the Saracens into Spain and brought about the fall of the Visigothic Kingdom (711).

FLORIN'ANS. A Gnostic sect, of the second century, so called from a Roman presbyter, Florinus, who introduced doctrines resembling those of the Valentinians (q.v.) into Rome in the latter part of the second century. See GNOSTICS.

FLORIO, JOHN (?1553-1625). An English author, son of a Florentine Protestant, who fled to England. He taught Italian at Oxford and London, the Earl of Southampton (Shakespeare's friend) having been among his pupils. In 1603 he became reader in Italian to Queen Anne, and in 1604 he was appointed groom of the privy chamber. He passed the last five years of his life at Fulham and died in 1625. He is author of *First Fruits which yield Familiar Speech, Merry Proverbs, Witty Sentences, and Golden Sayings* (1578); the well-known Italian-English dictionary, *A World of Words* (1598); and an excellent translation of Montaigne's essays (1603), often reprinted.

FLORIS, flō'rēs, FRANS (properly De Vriendt) (c.1517-70). A Flemish painter of the Renaissance. He was born in Antwerp. The son of a stonecutter, he first studied sculpture, then took up painting under Lambert Lombard at Liège. Probably directed by that master, he went to Rome and studied the works of Michelangelo and Raphael. Returning to Antwerp in 1540, he opened a school, which is said to have furnished instruction to 120 pupils. He enjoyed the patronage of William of Orange and Counts Egmond and Horn, adorned the houses of many Spanish nobles and Antwerp dignitaries, and was in charge of the decorations for the reception of Philip II in 1549 and 1556. Among his most characteristic pictures are "The Last Judgment," in the Brussels Museum; "Lot and his Daughters," in the Dresden Gallery; and "The Fall of the Rebellious Angels" in the Antwerp Museum. His admiration and study of Michelangelo are plainly to be seen in the complicated attitudes of his figures, which are boldly conceived; but taken as a whole, his works are artificial and mannered. The most important of his portraits, which are better than his other subjects, is "The Falconer" (Museum of Brunswick).

FLORIS'SANT BEDS. A small group of sedimentary rocks in the South Park, Colorado, at Florissant, famous for its early Tertiary fossils. The beds occupy the site of a fresh-

water lake that during Eocene or Oligocene time was filled by a deposit of fine volcanic ash, now consolidated into thin papery shales. Within them have been found the remains of plants, fishes, and insects in great profusion and variety; over 700 species of insects from the locality have been described by Scudder in the reports of the United States Geological Survey.

FLORIS'TICS (from Lat. *flos*, flower). The division of phytogeography which treats of plant distribution from the standpoint of classification (taxonomy) rather than from the standpoint of environment (ecology). See DISTRIBUTION OF PLANTS; ECOLOGY; TAXONOMY.

FLOR'IZEL. The Prince of Bohemia, in Shakespeare's *Winter's Tale*.

FLORIZEL, or **FLORISEL**, **DE NIQUEA**. A supplement by Feliciano de Silva to the mediæval romance *Amadis of Gaul*.

FLORIZEL AND PERDITA. The name given by Garrick to his revision for the stage of Shakespeare's *Winter's Tale*, which was produced Jan. 21, 1756, at the Drury Lane.

FLOR'US. A Roman historian, who flourished in the reign of Trajan or Hadrian. He is generally, on manuscript authority, called L. Annaeus Florus. Of his life we know very little. He wrote an epitome of Roman history (*Epitomæ de Tito Livio Bellorum Libri Duo*) from the foundation of the city to the time of Augustus. This work, which is still extant, is intelligently composed, but at times inaccurate and partial. It is based, as its title shows, on the history of Livy. The best editions are by Halm (Leipzig, 1879) and Rossbach (ib., 1896). Consult Teuffel, *Geschichte der römischen Literatur*, vol. iii (6th ed., ib., 1913).

FLOSS SILK (from OF. *flosche*, It. *floscia*, floss, from Lat. *fluus*, soft, flaccid, from *fluere*, to flow). Silk fibre from the finest part of the cocoon, after all that can be reeled off has been removed. It is carded and spun, but not twisted, so that its texture is soft, downy, and lustrous. It is used chiefly for embroidery. See SILK.

FLOTATION. See HYDROSTATICS.

FLOTE. See FLOTTE.

FLOTOW, flō'tō, FRIEDRICH VON (1812-83). A German composer of light opera. He was born at Teutendorf, Mecklenburg, the son of a minor landed nobleman. He was at first educated for the diplomatic service, but early decided to devote himself entirely to music. A period of study in composition under Reicha, at Paris, was brought to a termination by the revolution of July, 1830; whereupon he returned to Mecklenburg and devoted himself to composition. He was unfortunate with his earlier operas, which were refused by the managers of the important Paris theatres; but his success was compensatingly great upon the production of *Le naufrage de la Méduse*, in 1839, at the Théâtre de la Renaissance. *Le forestier*, *L'Esclave de Camoëns*, *L'Ame en peine*, *Indra*, and *L'Ombre* were among his successful operas, but only two are still in the modern repertoire, *Alessandro Stradella* and *Mariha*. His operas were characterized by easy and lively dramatic action, readiness of invention, facility of expression, pleasing melodies, and graceful instrumentation. In 1856 he received the appointment of intendant of the court theatre at Schwerin and was elected a member of the French Institute in 1864. He died at Darmstadt.

FLOT'SAM. Goods which are cast overboard for the safety of the ship or in case of wreck and

which are afterward found afloat. The term "wreck" is, in legal acceptance, confined to a vessel or cargo or any part thereof which is cast ashore. From wreck are distinguished those goods known to the common law as *flotsam*, *jetsam*, and *ligan*. The first is the term applied where the goods continue floating on the surface of the waves; the second where, being cast into the sea, they sink and remain under water; the third where they are sunk in the sea, but are tied to a cork, bladder, or buoy, in order that they may be recovered.

By the common law wreckage proper became the property of the crown, immediately if no evidence of ownership came ashore with the wreck, otherwise if unclaimed for a year and a day. But of flotsam, jetsam, and ligam there was no forfeiture to the crown except upon the failure of the owner to present himself and claim his property. The disposition of such goods, whether belonging to the category of wreck or of flotsam, etc., is now regulated by statute both in England and the United States, it being usually provided that the local authorities where such goods are found or where they are brought by the finder shall have the custody of them for the owner. See WRECK; also ADMIRALTY LAW; SALVAGE; DERELICT.

FLOTTE, flôt, or **FLOTE**, PIERRE (c.1250-1302). Chancellor of France, Minister of Philip the Fair, born in Auvergne. He was sent on important missions by the King in 1293 and was at court in 1296. About two years afterward he was sent to Rome for the canonization of Louis IX, and in 1299 he went to England as Ambassador. He was in the thick of the quarrels between Philip the Fair and the Pope and was the first layman to be Chancellor of France. He was killed at Courtrai.

FLOUNDER (Ger. *Flunder*, from ODan. *flundra*, OSwed. *flundra*, flounder). A name for any of the many marine fishes of the family Pleuronectidae (see FLATFISH), which includes the halibut, dab, plaice, fluke, etc. The body is more or less elongate, always much compressed, and with the dorsal and anal fins extending for the greater length of the body; the scales may be absent. The flounders possess the remarkable character (unique among vertebrates) of swimming, not with the back, but with one side uppermost. The peculiarly twisted structure of the head is adapted to this mode of life, both eyes being on the same side of the head. When young, the eyes, as in other fishes, are on each side of the head, and they swim erect; but as the fish grows older, one eye moves to the other side, either around the edge or right through the head. The side of the body which is uppermost is normally colored, the particular coloration usually corresponding strongly to the color of the bottom on which it dwells, while the side which habitually lies downward is white or faintly colored. Flounders abound chiefly where the bottom is smooth, either sandy or muddy. The family is a very large one, including about 55 genera and 500 species. They are found in all oceans, some of them living in brackish waters and even entering rivers. Some of the species grow to an enormous size—500 pounds. They are very important food fishes. (See FISHERIES.) The family is divided into three tribes, viz.: (1) Hippoglossinae, the halibuts, having a large, symmetrical mouth and the ventral fins symmetrical (see HALIBUT); (2) Pleuronectinae, the flounders proper, with a

smaller, unsymmetrical mouth and the ventral fins symmetrical or almost so; and (3) Psettinæ, the turbot (q.v.), having a large mouth and the ventral fins unsymmetrical.

The most important species of the coast of the Northern States is the summer flounder (*Paralichthys dentatus*), also called plaice, or deep-sea flounder, which may reach a length of 3 feet and a weight of 15 pounds, but usually is much smaller. Like the others, it is carnivorous, feeding on shrimps, crabs, small fish (which it often pursues rapidly at the surface), and even on carrion. It is most abundant on the shallow, sandy bottoms around Long Island, N. Y., where it is taken between May and October in vast quantities. Another very similar species replaces this on the southern coast, and still another in the Gulf of Mexico. The four-spotted flounder (*Paralichthys oblongus*), which has four oblong blackish spots, frequently comes to market. The "common," or winter, flounder (*Pseudopleuronectes americanus*) is also valuable as a food fish. The best-known species of the Pacific coast is the diamond flounder (*Hysopsetta guttulata*), brown blotched with bluish, and constantly caught for market. Several species are among the food fishes of Alaskan waters, even along its Arctic coast. The pole flounder is a species (*Glyptocephalus cynoglossus*) of a group known as "flukes," and in England, where it is common and highly prized, it is called "craig fluke."

Consult Goode, *Fishery Industries*, sec. i (Washington, 1884), and Jordan, *Fishes* (New York, 1907). See *Factors of Organic Evolution* in the article EVOLUTION. See Plate of FLATFISH AND FLOUNDERS.

FLOUR (formerly a variant of *flower*, q.v., for etymology) and **FLOUR MILLING**. Flour is the ground and bolted substance of wheat (*Triticum vulgare*). The name is also applied to other grains when ground, as rye flour, buckwheat flour; but if the grain from which the flour is made is not specified, the unqualified term, both in common and commercial usage, means wheat flour. The comparative importance of its production is shown from the fact that, of the total cereal products milled in the United States in 1909, 57.7 per cent were from wheat. Corn meal, of which 28 per cent of the total product consisted, ranked next, the remaining 17.3 per cent being divided among the other cereals. That the use of wheat flour to the exclusion of all the other grains is not due to the higher nutritive value of wheat is shown from the accompanying table:

made up chiefly of two proteins, glutenin and gliadin, the quality depending on the proportion of each. In general soft wheat flours contain 68 to 78 of the total nitrogen in the form of gliadin, and hard wheat flours, 65 per cent or less. In flour of the highest bread-making properties glutenin and gliadin are present in such proportions that they form a well-balanced gluten. From available data it would appear that the proper proportion for the gluten of hard wheat flour is 65 per cent gliadin to 35 per cent glutenin. Occasionally the percentage of gliadin may fall as low as 55 per cent. Any great variation from the ratio mentioned has a marked influence upon the character of the bread. Advantage is taken of this fact in milling when wheats of opposite type, one with high and the other with low gliadin content, are mixed before grinding in order to improve the quality of the flour. The adhesive or sticky quality of wheat flour enables it to retain the carbonic-acid gas formed by the agency of yeast or baking powder and thus produces "lightness" in the bread. For the same reason other flours are used most successfully when combined with wheat flour. The other flours are rarely used alone for bread, except rye flour, from which the "black bread" of Germany and northern Europe is made. The rye bread usually sold in the United States is prepared from a mixture of rye and wheaten flour. In the southern United States corn bread is often made without the addition of wheat flour.

Historical Development of Milling Processes. Long before the dawn of history cereals formed an important article of food for the human race. At first these grains were used in the crude state, without grinding or cooking. But agriculture was one of the earliest arts of civilization to be developed, and the cereals among the first of the agricultural products to receive cultivation. It must have been discovered very early that, both from the standpoint of mastication and flavor, grain is much improved by grinding, so that the first milling processes came soon after the cultivation of the soil. The earliest history we have regarding the grinding of wheat or corn dates back over 6000 years in the early days of the Egyptian peoples. At first a mere breaking up into coarse fragments by means of a mortar and pestle, or substitute, was all that was attempted. The second step in the development of milling processes was taken when for the mortar and pestle were substituted two roughened grinding surfaces, placed close together, between which the

The very extended use of wheat flour for bread is due to the presence in the kernel of gluten, a highly tenacious body, which is not present in the same form in other cereal flours. Gluten is

grain was reduced to powder. This use of the upper and nether millstone for grinding grain also dates back to prehistoric times. An improvement over this simple device is the *quern*,

or hand mill, still used among semicivilized peoples. The use of animal and then of water power by the Greeks (450–400 B.C.) and Romans (350–300 B.C.) to turn the millstones came much later. About 400 years after the Romans invented the vertical water-wheel mill drive, they made the ship mill, which floated and was operated by a flowing stream or tide. The wind-mill was first seen in 600 A.D. At first the arms of the mill revolved on a tripod stand, but later a turret or tower displaced it, and from the latter the old picturesque mill evolved. The first successful steam flour mill was erected in London in 1784. The use of millstones for grinding flour was universal until the close of the eighteenth century, and is still so common, especially in small "customs" mills—mills which grind for a stipulated sum (fee) or instead take a part of the grain which is brought to the mill for grinding—that a brief description of this process of milling is given. The millstones are made of buhrstone, a form of silica as hard as flint but not so brittle. The best buhrstones are said to come from France. They are usually from 4 to 6 feet in diameter, and each consists of a number of pieces strongly cemented and bound together with iron hoops. The grinding surface of each stone is furrowed or grooved, one side of each groove being cut perpendicularly and the other side being inclined to the surface of the stone.

Fig. 1 shows a section of a flour mill of the old type. The millstones are at *a*, the lower of

FIG. 1. OLDER FORM OF FLOUR MILL.

which is firmly fixed, and the upper is made to revolve. Motion is communicated by the spur wheel *b*. The grain, previously cleaned, is fed to the millstones by means of the hopper, *c*, connected with which there is a valve, *d*, for regulating the supply. The millstones are, of course, inclosed, and the flour passes down through the spout, *e*, to the worm conveyer at *f*, which carries it along to elevators, *g*. These raise it up to the floor, on which the dressing machine, *h*, is placed. Hoppers, *i*, are placed below the dressing machine, by means of which the flour and bran are filled into sacks.

The third and final step in the development of milling processes was taken when rollers were substituted for stones to perform the grinding process. Iron rollers were generally used at Pest to grind wheat before 1840 and, under the name of the Hungarian system, rapidly spread throughout Europe. As early as 1810 Ignés Paur, of Austria, invented a middlings—the mealy part (endosperm) of the grain more or

less free from bran and germ, the coarser part of the meal is termed semolina—purifier which is described below. It is claimed that in 1868–70 E. N. LaCroix, a French miller, independently invented a system of roller milling similar to the Hungarian system and installed it in one of the great flour mills of Minneapolis. Its introduc-

FIG. 2. MAGNIFIED SECTION OF GRAIN OF WHEAT.

tion marked an epoch in the production of flour. The essence of this new process is the substitution for a single grinding between millstones of a succession of grindings between several sets of iron or porcelain rollers. As a musty odor and dark color are given to flour if it is heated during the process of manufacture, the rollers are kept cool.

The endosperm, *A*, which occupies the central and larger portion of the wheat kernel, is the chief storehouse of starch. It is made up of cells in which small starch grains are held in a network of gluten. At the lower end of the grain is the germinal portion, *C*, containing the embryo and scutellum. The germ, in addition to carbohydrates and nitrogenous matter, contains a large proportion of fat.

The wheat kernel is surrounded by five layers which make up the bran; viz., the epidermis, epicarpium, endocarpium, testa, and episperm. The three outermost layers are called the skin.

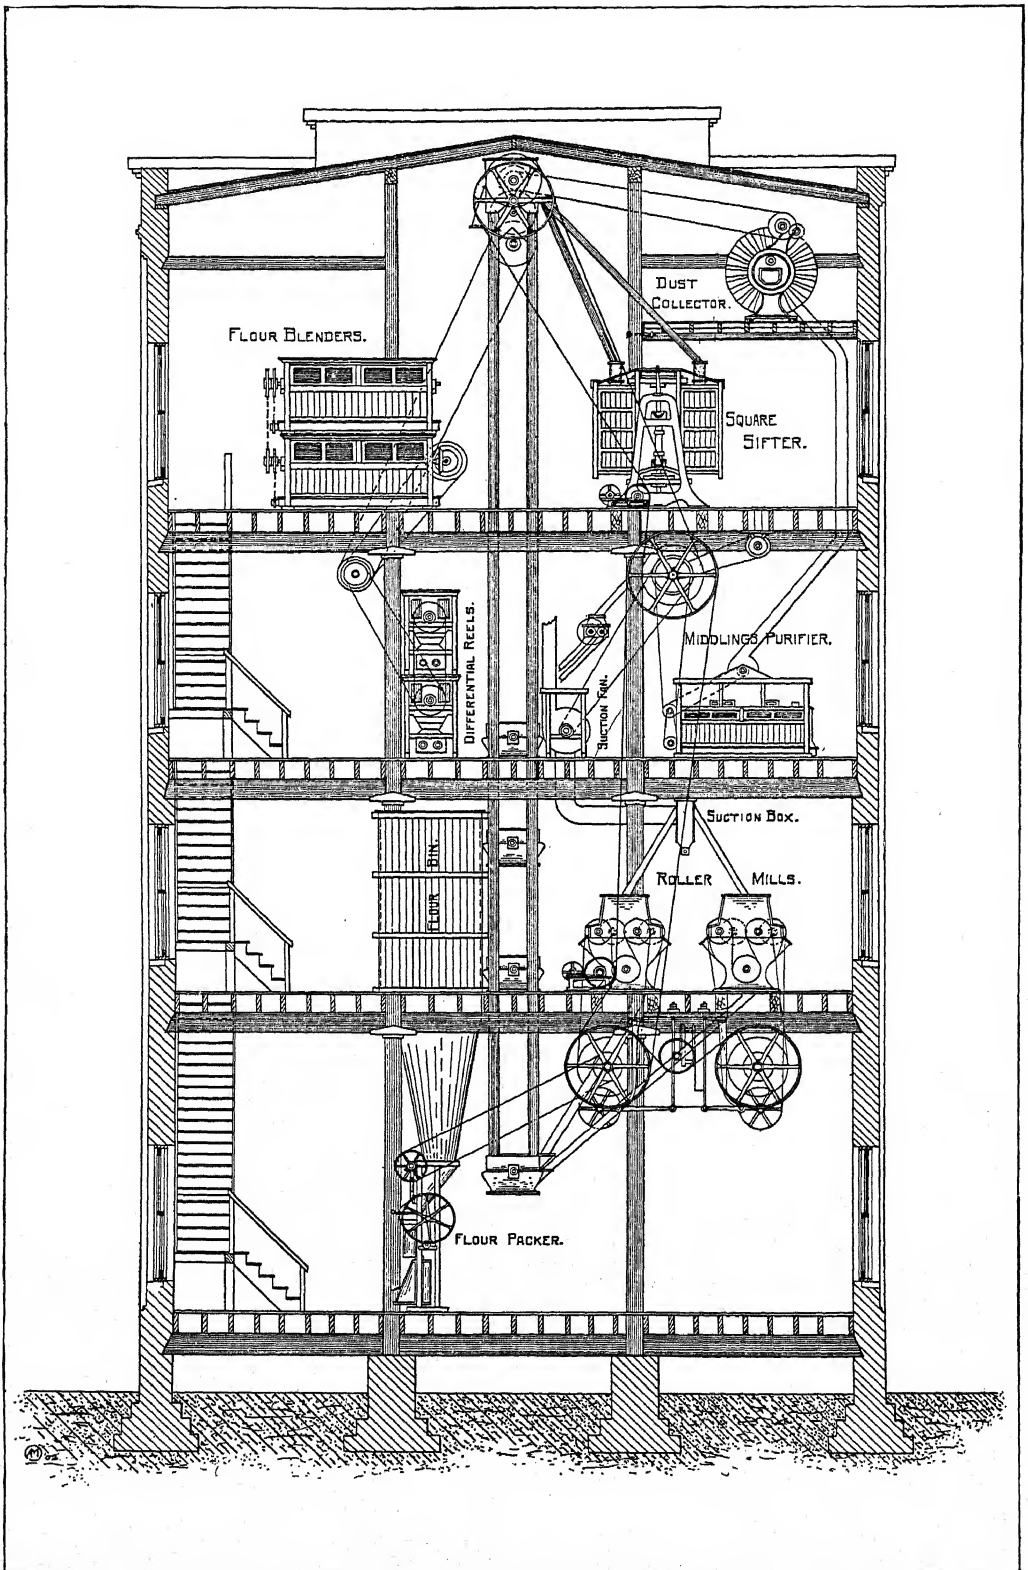

FIG. 3. A MODERN DOUBLE ROLLER MILL.

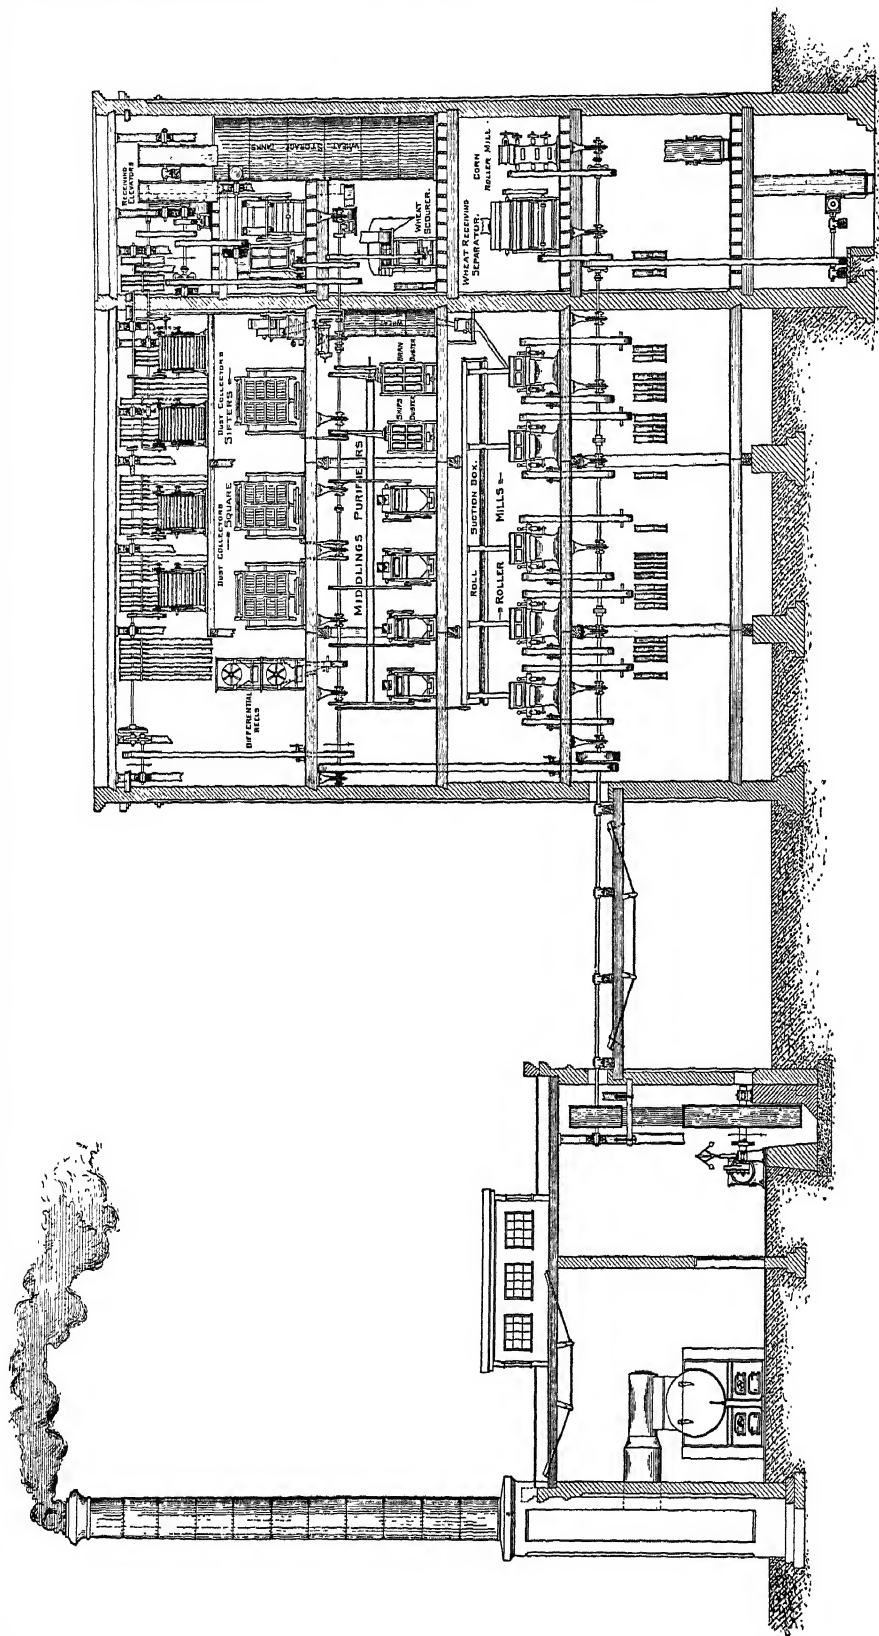

Between the innermost of the bran layers and the flour cells (endosperm) lies the cereal or aleurone layer, *B*, which consists of rectangular cells filled with a nitrogenous substance called cerealine or aleurone and has a high food value. The fine layers of the bran *D* contain a high percentage of cellulose, which at one time was

(From Plans furnished by the Nordyke and Marmon Company, Indianapolis, Ind.)

thought to be entirely indigestible. Some phosphates and other mineral matters are found in all parts of the wheat berry, the amounts being especially high in the bran. Bran also contains an organic phosphorus compound called phytin. This substance in conjunction with the inorganic phosphates is thought to have a stimulating effect on loaf volumes and is said to produce a bread of better texture and color. The coloring matter of flour, carotene, is closely related chemically to lutein, or lipochrome. Certain enzymes or ferments, i.e., diastasic, proteolytic, catalytic, and oxidizing, are present in flour.

Two main grades of wheat are known to the miller: *winter* wheat, or that sowed in the fall and coming up in the early spring; and *spring* wheat, which grows during the summer and is harvested in the fall. The winter wheat, whose

FIG. 4. SECTION OF A MODERN ROLLER MILLING MACHINE.

kernels are softer and more starchy, is more easily separated from the husk than the spring wheat, whose kernel is much harder and much richer in gluten. The harder or more flinty the wheat, the more difficult becomes the process of separating it from the husk.

In modern milling the object is to obtain as much flour of good appearance and quality as possible and to diminish the yield of bran and shorts to a minimum. The wheat is thoroughly screened (dry cleaned) and scoured before milling. According to the brittleness of the wheat it is either dampened, soaked, or steamed—generally the latter—so that the bran may not split up into fine particles and contaminate the flour. Sometimes after a wet, cool harvest it is necessary to dry some of the grain in order to obtain a uniform degree of hardness, toughness, and mellowness. This is necessary because it insures each individual grain almost the same degree of breaking down in the reduction process. Each step in the reduction process of milling, i.e., each passage through a pair of rollers, is called a *break*. The first break flattens some of the softer kernels, splitting them into longitudinal grooves, and produces a small amount of flour known as first break flour, and middlings, known as first middlings, which are then passed on to other rolls for reduction. The number of streams of flour depends upon the system employed. At the present day the four break systems are in the majority. The modern milling system, instead of pulverizing or reduc-

ing the grain into a variable mass of skins, endosperm, and other vegetable tissues, as hairs and debris, operates stepwise, breaking the kernel or berry slowly and at each operation sifting away and purifying any of the freed particles of the endosperm before dispatching the ruptured grains to the next rollers for further treatment. The middlings, tailings, and chops are passed on from roller to roller until all the fine flour particles are reduced, removed, and purified. Each break effects a mechanical separation of the chop into break flour, middlings flour, and tailings, and this process is repeated until finally the flour stock is practically all removed from the offals, as the wheat by-products not suitable for human food are called.

The different streams of break flour and middlings flour are blended so as to form either standard grades or special commercial brands of flour, and usually wheats of different quality are mixed before grinding so that a flour of definite characteristics may be produced. The standard grades are: First Patent, Second Patent, Straight Grade, First Clear, Second Clear, and Red Dog. Standard patent flour, which is the bread flour most commonly found on the market, includes the first and second patent grades and the first clear or bakers' grade of flour.

In flour making the germ is commonly removed because it contains a considerable amount of fat which readily becomes rancid and injures the quality of the flour if the germ is retained in it. In modern milling over 70 per cent of the wheat is recovered as standard patent flour, about 1 per cent as low-grade flour, about 2 per cent as Red Dog flour, and the remainder as shorts or bran. Up to 1908 most of the higher and other grades of flours of the United States were bleached with nitrogen peroxide. The United States Secretary of Agriculture, J. Wilson, ruled (Decision 100) that the use of such flours was detrimental to health. Moore and Wilson in a more recent investigation showed that bleaching by this agent is not a more rapid achievement of a slowly occurring natural process.

Besides the flours enumerated above, Graham flour and whole-wheat or entire-wheat flour are commonly found in market. The Graham flour is unbolted wheat meal ground from the whole kernel. There are on the market many imitation Graham flours made by mixing inferior grades of flour with bran. The old method of making Graham flour, i.e., by grinding the whole wheat berry on stones or rolls, is still in use in many of the mills. The so-called whole-wheat or entire-wheat flour contains all of the kernel except a portion of the bran. The patent and clear grade flours contain the endosperm and very little of the bran, germ, and embryo.

The Graham and entire-wheat flours are somewhat superior to patent flour as regards composition, but extended experiments have shown that they are inferior as regards percentage of digestibility. The coarse flours are useful in the diet, as they tend to counteract constipation. Flours of all sorts are very thoroughly digested and are extremely valuable and economical foods. The use of different sorts is a convenient way of adding to the variety of the diet. See also **BREAD; WHEAT.**

Gluten flours, from which the starch has been almost entirely excluded, have also been manufactured and are valuable in certain forms of dyspepsia, where there is an inability to digest carbohydrates, and particularly in the diet of

those suffering from diabetes mellitus. Many flours sold as diabetic or gluten flours to-day can hardly with justice to the invalid be used for the purpose for which they are intended.

Self-Raising Flour. This is simply a flour into which has been mixed some chemical leavening agent, such as an ordinary baking powder, or its constituents. This is possible, because bicarbonate of soda and tartaric acid, e.g., do not combine to produce carbonic-acid gas except in the presence of water. Self-raising flour is similar to other flour in composition, save for the higher ash content due to the baking powder added. It is used to a considerable extent in domestic cookery. See **BREAD**.

Quality of Flour. It is very important for millers and bakers to know the quality of flour, and various methods have been proposed for ascertaining it. While the general characteristics of the wheat, e.g., the weight per barrel, size of the granules, color, plumpness, absence of blemishes, etc., all affect the flour and can be observed by inspection, the commercial value of the flour itself can best be learned by studying a number of its qualities.

The appearance, quality, amount, and character of the bread obtained from a given quantity, and similar factors are important in judging of the quality. It has been found that a study of the various chemical properties furnishes a means of judging of the quality, and the chemist who examines flour takes into account especially the moisture content, acidity, amount and proportion of different nitrogenous constituents (proteins), capacity to absorb water, degree of granulation, color, fat content, and the power of expansion and tenacity of the gluten.

The range of absorption of water in different kinds of flour is considerable and is of much importance, as it greatly influences the number of loaves which may be produced from a barrel of flour. In general, flours with a high gluten content have the greatest capacity for absorbing water, the absorption number ranging from 60 to 66, while flours with a low gluten content absorb less water, the absorption number ranging from 55 to 59. The actual and most reasonable test of flour is the kind of bread it will make. All well-conducted mills have experimental bakeries wherein their product is tested.

Flour Manufacture in the United States. In Colonial days large quantities of wheat were raised and converted into flour in America; but with the Hessian soldiers of the Revolution was imported the Hessian fly, a scourge which literally drove the production of wheat across the Alleghanies. Since that time the centre of wheat and flour production has steadily moved to the Northwest. In 1815 a steam flour mill, having a capacity of 700 barrels per week, was built at Cincinnati. The first merchant mill in Minneapolis was erected in 1854. During the last half century the importance of the latter city as a milling centre has increased so rapidly that it now ranks first in the world as a producer of flour. With the new process of flour manufacture came the era of the big flour mill. This was due partly to the fact that the machinery involved is too complicated and expensive for the small manufacturer and partly because this change is simply in line with modern industrial development. In the report on flouring and gristmill products of the United States census of 1910 (statistics of 1909) a distinction

is made between merchant and customs mills, and from the statistics given it is evident that milling on a small scale is still a flourishing industry. Customs mills are defined in this report as mills grinding wheat, corn, and other grain furnished from farms in the neighborhood and are usually denominated *gristmills*. Merchant mills are large manufacturing establishments supplying the home market and exporting flour to the principal foreign countries. In mere numbers the customs or exchange mills constitute 50.5 per cent of the total number of milling establishments. The largest number of small mills was found in Pennsylvania, and of mills of the greatest capacity in Minnesota. The total number of merchant flour mills grinding wheat was 7342, of which 1721 belong to the class producing less than 1000 barrels per annum. The growth of the milling industry in general during the last half century is shown by the following statistics: In 1850 there were 11,891 establishments in the United States engaged in milling cereal products; in 1909 there were 123,652 such establishments. In 1850 the capital thus invested amounted to \$54,415,581, and the value of the annual product to \$136,056,736; in 1909 the capital invested amounted to \$370,410,289, and the annual product to \$938,699,953, of which \$883,984,000 was the product of flouring mills. The share of the wheat which is exported from the United States in the form of flour ranges from 30 to 70 per cent. In years of large exports the share which is turned into flour before exportation is from 25 to 35 per cent, but in years of small exportation the share ranges from 60 to 75 per cent.

FLOUR BEETLE, or WEEVIL. Any of several species of minute, flattened, reddish tenebrionid beetles infesting flour, meal, and all sorts of stored manufactured cereals. They may do great damage in warehouses and mills, the annual loss in the United States from this cause amounting to \$100,000 or more, and constantly increasing. Our most common species are *Tri-*

bolium confusum and *Tribolium ferrugineum*, which lay their eggs in cracks of barrels, etc., which hatch speedily into minute larvæ that feed upon the flour and then transform into pupæ. These develop into adults so rapidly that in favorable warm places several broods a year may arise. The beetles often bore holes into the wood. Nothing short of thorough scalding will efface them, but painted receptacles aid in keeping them out. The larvæ of larger beetles of similar habits are called meal worms (q.v.).

FLOURENS, *flōō'rān'*, GUSTAVE (1838-71). A French politician and author, born in Paris, son of the physiologist, Marie Jean Pierre Flourens. In 1863 he became deputy professor of natural history at the Collège de France, where his liberal views, particularly about the multiple origin of the human race, roused the opposition of the clergy, who forced his resignation. He went to Belgium and later to the East, took an important part in the Cretan insurrection (1866), and was elected to the National Assembly of Crete, which he also represented at Athens. After his return to France in 1868, his attacks on the Empire caused his arrest (April, 1869), and upon his release from a three months' imprisonment he was wounded in a duel with the Bonapartist Paul Granier de Cassagnac (q.v.). For an attempt at armed resistance on the occasion of the arrest of Henri Rochefort (q.v.) in 1870, he was sentenced to imprisonment for three years. He escaped, however, to England, whence he returned to become a Communist leader during the siege of Paris. Upon the proclamation of the Commune (March 18, 1871), which he had been one of the first to urge, he was elected a member and appointed colonel. He was killed during the march on Versailles. He published *Histoire de l'homme* (1863), his first lectures, and *Science de l'homme* (1865). Consult *Gustave Flourens et l'insurrection crétoise de 1866-68* (Paris, 1893), and C. Prolès, *Les hommes de la révolution de 1871* (ib., 1898).

FLOURENS, LÉOPOLD EMILE (1841-). A French politician, born in Paris, a brother of Gustave Flourens. He was auditor of the Imperial Council from 1863 to 1868 and in 1879 was appointed head of a department in the Ministry of Education, in which capacity he took part in all anticlerical ordinances. In March, 1885, he became President of the departments of Legislation, Justice, and Foreign Affairs in the Council of State, and President of the Deliberative Commission on French protectorates in the Ministry of Foreign Affairs. In 1886 he became Minister of Foreign Affairs in the Goblet cabinet, and succeeded in adjusting peaceably the Schnaebelé affair (April, 1887). Flourens retained his portfolio during the Rouvier and Tirard cabinets until April, 1888. In 1888 he was elected to the Chamber of Deputies, where he acted with the moderate Republicans, was reelected in 1889 and 1893, defeated in 1898, and was again successful in 1902. He published *Organisation judiciaire et administrative de la France et de la Belgique de 1814 à 1875* (1875), for which a prize was awarded by the Academy, and *Alexandre III: sa vie, son œuvre* (1893).

FLOURENS, MARIE JEAN PIERRE (1794-1867). A celebrated French experimental physiologist and author, born at Maureilhan, Hérault. After having obtained his degree of M.D. at Montpellier, at the age of 19, he pro-

ceeded to Paris. He was assistant to Cuvier in 1828-30, and in 1832 he succeeded him as professor of natural history in the Jardin du Roi. In 1833 he succeeded Dulong as perpetual secretary of the Academy of Sciences, in 1835 he became professor in the Collège de France, and in 1840 the French Academy elected him a member. He was made a peer of France by Louis Philippe in 1846. He died at Montgeron, near Paris. For more than 40 years Flourens was a voluminous writer on human and comparative anatomy and physiology, on natural history, and on various special departments of the history of the natural and physical sciences. Among his most important works are: *Recherches expérimentales sur les propriétés et les fonctions du système nerveux dans les animaux vertébrés* (1824), with a supplementary volume, entitled *Expériences sur le système nerveux* (1825); *Recherches sur le développement des os et des dents* (1845); *Anatomie générale de la peau et des membranes muqueuses* (1843); and his *Théorie expérimentale de la formation des os* (1847), perhaps the most celebrated of his works. Among his smaller and popular works are his *De l'instinct et de l'intelligence des animaux* (1841); *Histoire de la découverte de la circulation du sang* (1854); *De la longévité humaine, et de la quantité de vie sur le globe* (1854); *Eloges historiques* (3 vols., 1856-62).

FLOWER (OF. *flor*, *flur*, *flour*, *fleur*, Fr. *fleur*, from Lat. *flos*, flower, from *florere*, to bloom; connected with OHG. *bluoma*, Ger. *Blume*, Goth. *blōma*, Icel. *blōme*, Eng. *bloom*, Ir. *blāth*, flower, and ultimately with Lat. *folium*, Gk. *φύλλον*, *phyllon*, leaf). A structure developed by the higher plants only, and chiefly concerned in the production of seeds. An exact definition of a flower is very difficult, but the popular conception is clear enough for this presentation. Not all plants which produce seeds can be said to have true flowers, since the conifers and their allies no more possess true flowers than do many of the fern plants.

Parts of Flower. The parts of an ordinary flower may be illustrated by the buttercup. In this case it is observed that four distinct members enter into the organization of the flower. The outermost set is a "calyx," whose individual members are the "sepals"; the next inner set is the "corolla," whose individual members are the "petals"; the "stamens" form the third set; and the "carpels" are in the centre. The sepals and the petals are the characteristic floral leaves, while the stamens and carpels are the spore-producing members ('sporophylls'). The calyx and corolla taken together are frequently spoken of as the "perianth," the name being specially applied in case the two are similar, as in the lily. Since the whole purpose of the flower may be said to be the production of seed, the stamens and carpels are the essential organs; without them no seed could be produced. In another sense, however, the calyx and corolla are the characteristic organs, since it is their association with the stamens and carpels which distinguishes the true flower of the highest group of plants (angiosperms).

Functions of Parts. The calyx is usually merely a protective structure, being generally leaflike or bractlike, and investing the more delicate inner members in the bud. The corolla is usually connected with pollination (q.v.), being in general the conspicuous and showy part

of the flower. The stamens produce the pollen; while the carpels produce the ovules, which later become the seeds. The stamen usually has two regions, a stalklike portion called the "filament," and a spore-bearing region called the "anther." The carpel usually has two regions, the basal part, containing the ovules, being the "ovary," and the more or less elongated beaklike process from it being the "style." The style always presents in some portion, frequently the tip, a specially prepared surface, known as the "stigma," for the reception of the pollen. The name "pistil" is frequently applied to the carpel structures and is often a convenient name, although it is not an exact one. For example, each individual carpel may in certain cases be a pistil, as in the buttercup; while in other cases several carpels may have developed together as a single organ, which is also called the pistil, as in the apple. The term "pistil," therefore, may be defined as any organization of carpels which appears as a single organ with one ovary.

"Type Flower" and "Modifications." Since the structure of the flower is so extensively used in classification, there has come to be associated with it an enormous mass of technical terms, most of which are of no value except to the professional botanist. As the important terminology deals with the so-called "modifications," it will be given in connection with a description of the various relations which the floral members hold to one another. In the older morphology a so-called "type flower" was assumed, and all variations from it were regarded as modifications of this type. This false conception in great measure has been abandoned, and flowers are recognized as having developed along many different lines from exceedingly primitive conditions. For example, the flower of the lily was once regarded as a typical monocotyledonous flower, and all simpler forms were thought to be modifications of this type. The possible transition from the flower of a lily to that of a grass has often been cited, the meaning being that a grass flower is merely a reduced lily flower. The present view, however, is that the simpler grass flower is more likely to be a primitive condition than a derived one. It is impossible as yet to distinguish all the lines along which flowers have advanced, and the relations of these lines to each other. Certain prominent lines, however, are conspicuous and may serve as illustrations. In all of this evolution of flowers the end attained seems to be a better scheme for the transfer of pollen, chiefly by means of insects, or better devices for the scattering of seeds, or both. These conspicuous paths of advance may be summarized briefly as follows:

Diversity of Flowers. In the most primitive flowers the parts have a spiral arrangement. For example, the sepals, petals, and stamens are not in definite rosettes or cycles, but appear at different levels and may be indefinitely repeated. In this case there is no such thing as definite numbers. In the more highly developed flowers, however, the spiral arrangement passes into the cyclic, in which the members of each set form a definite rosette or cycle, in which the numbers are limited. Usually these numbers are definite for great groups, the prevailing number in the cyclic monocotyledons being three and the prevailing number in the cyclic dicotyledons being five or

four. One of the common causes of diversity among flowers is the absence of one or more of the four sets, or of some member or members in a single set. This may be the primitive condition of the flower, in which the given set or member is not to be expected; or it may be a case of abortion or suppression, which means that organs which are to be expected have failed to develop, although they may do so partially. As prominent illustrations of such diversities the following may be mentioned. It frequently happens that but a single set of floral leaves appears, and it is customary to regard the missing set as the petals, such flowers being called "apetalous." In other cases neither calyx nor corolla appears, in which case the flower is said to be "naked." In still other cases the stamens are lacking, and if a pistil be present the flower is said to be "pistillate." If the pistil is lacking and the stamens are present, the flower is "staminate"; while if both stamens and pistils are lacking, the flowers are "neutral."

Other diversities arise from the fact that the members of a set may to greater or lesser degree lose their independence and develop in common, giving the appearance of coalescence. For example, the sepals may organize an urn-shaped or tubular calyx, or the petals may organize a corolla which resembles a tube, a funnel, a bell, etc. The terminology used in such cases implies that members originally separate have coalesced; but the fact is that there has been no coalescence of distinct parts, but a ringlike outgrowth instead of growth at separate points. Flowers with a corolla of this kind are said to be "sympetalous" ("monopetalous," "gamopetalous"). The same tendency is shown by the stamen set; while it is exceedingly common among the carpels, in which latter case the flower is said to be "syncarpous," resulting in the so-called "compound pistil." The sympetalous character of flowers is so definitely associated with natural groups that the character gives name to the great group Sympetalæ, which is one of the two large divisions of dicotyledons. The contrasting condition of flowers, viz., the occurrence of petals entirely distinct from one another, is called "polypetalous," such flowers being regarded as more primitive than sympetalous flowers.

Another source of diversity in flowers is the tendency of contiguous sets to become more intimately related than usual. This condition is common in sympetalous flowers, where the stamens are said to be "inserted upon the tube of the corolla." This apparent coalescence of adjacent sets is frequently called "adhesion," a term which implies that the two sets are normally distinct, but have become adherent. Such an explanation is no more true than that which was given of the apparent coalescence of the members of a single set. This tendency of different sets to arise together, rather than separately, has resulted in three well-marked conditions. When the sepals, petals, and stamens all rise from beneath the ovary, the flower is said to be "hypogynous," or to have a "superior ovary." This is the most primitive condition. When these three outer parts arise from the rim of an urnlike outgrowth from the receptacle ("torus"), which surrounds the pistil or pistils, the flower is said to be "perigynous." Finally, the insertion of the outer parts may be carried above the ovary, from the summit of which the

FLOWERS

1. WILLOW (*Salix*), showing staminate (a) and pistillate (b) flowers; 2. PEAR (*Pyrus*); 3. ELM (*Ulmus*); 4. RADISH (*Raphanus*); 5. ANEMONE; 6. SAVORY (*Satureia*); 7. PEA (*Pisum*); 8. MOUNTAIN LAUREL (*Kalmia*); 9. TOBACCO (*Nicotiana*); 10. ARNICA, with ray (a) and dish (b) flowers; 11. EVENING PRIMROSE (*Oenothera*).

sepals, petals, and stamens seem to arise, such a flower being called "epigynous," or said to have an "inferior ovary."

Regularity and Irregularity. In the more primitive flowers the different members of a set are similar and are repeated uniformly about a common centre. Such a flower is said to be "actinomorphic," or "radiate," or more simply a "regular flower." In many cases, however, the members of a single set are not all alike, and this is particularly noticeable in the corolla. The unequal development of the members of a single set is called zygomorphism, or more commonly "irregularity."

The arrangement of the parts of the flower in the bud is known as "æstivation." See **BUD**, etc.

FLOWER, BENJAMIN ORANGE (1858-). An American author and editor, born in Ilion, Ill., and educated at Kentucky University. After some newspaper experience he settled in Boston and established the *Arena*. This magazine he edited until 1896 and from 1904 to 1909, in the interim having had charge of the *Coming Age*, which was eventually merged with the *Arena*. From 1909 to 1911 he was editor of the *Twentieth Century Magazine*. His publications include: *Civilization's Inferno* (1893); *The New Time* (1894); *Gerald Massey, Poet, Prophet, and Mystic* (1895); *Whittier, Prophet, Seer, and Man* (1895); *The Century of Sir Thomas More* (1896); *Persons, Places, and Ideas* (1896); *How England Averted a Revolution of Force* (1901; new ed., 1911); *Christian Science as a Religious Belief* (1909).

FLOWER, ROSWELL PETTIBONE (1835-99). An American capitalist and Democratic politician, born at Theresa, Jefferson Co., N. Y., where he worked on a farm and in a mill. He was clerk in a hardware store, assistant postmaster, and then a jeweler at Watertown. Going to New York in 1869 he made the banking house of Flower & Co. a recognized power in Wall Street and became director in various corporations. He was a member of Congress in 1881-83 and in 1889-91; was mentioned as a candidate for the Democratic nomination for the presidency in 1888; and was Governor of New York in 1892-94. In 1896 he was a Gold Democrat. His benevolences included Flower Hospital and St. Thomas's Home in New York City. A statue of Governor Flower by Saint-Gaudens was unveiled at Watertown, Sept. 1, 1902.

FLOWER, SIR WILLIAM HENRY (1831-99). An English biologist and anatomist, born at Stratford on Avon, Warwickshire. He graduated in medicine at the University of London in 1851 and was an assistant surgeon in the medical service during the Crimean War. In 1861 he was appointed curator of the Hunterian Museum of the Royal College of Surgeons of England, where he also became professor of comparative anatomy and physiology in 1870. From 1884 to 1898 he was director of the British Museum of Natural History. He was elected a fellow of the Royal Society in 1864 and from 1879 until his death was president of the Zoological Society of London. He was also president of the Anthropological Institute from 1883 to 1885, and at various times president of the anthropological section of the British Association for the Advancement of Science. His principal investigations have to do with the Monotremata and the marsupials, and his researches concerning the structure of the brain of lemurs

and apes are also important. He was the first to show that marsupials retain throughout their life history a permanent dentition, with the exception of one tooth, and that thus marsupials are differentiated from the other mammals. His publications, in addition to numerous memoirs, include: *Diagrams of the Nerves of the Human Body* (1861); *An Introduction to the Osteology of the Mammalia* (1870; 3d ed., revised, 1885); *The Horse* (1890); *Essays on Museums and Other Subjects* (1898).

FLOWER AND THE LEAF, THE. A poem published in the 1598 edition of Chaucer's works, but not now believed to be his.

FLOWER BEETLE. Any of many small beetles seen almost exclusively on flowers, feeding on pollen. The most common flower beetle in the northern United States is a yellowish-brown, black-spotted species (*Euphoria inda*), which feeds not only on the pollen of all sorts of flowers, but on the stalk and ears of young Indian corn and on various fruits and may become a serious pest. It flies in early spring close to the ground, with a humming sound very much like that of a bumblebee, and a second brood appears in September.

FLOWER BUG. One of a family (Anthoridae) of small bugs, distinguished from bedbugs by their long oval forms and by having wing covers and ocelli. Not many species are known, but individuals are extremely numerous, haunting flowers, where they hunt out and devour plant lice, lace bugs, and similar minute pests of horticulture. The commonest species is *Triphleps insidiosus*, which, like some of the others, is shining, black and white.

FLOWER DANCE. There were two distinctively floral dances in Greece—the anthema, which was danced by women at private gatherings, and the May dance, in which the most beautiful young girls decorated themselves with flowers and danced singing in honor of the goddess of the May. The song which was sung while dancing the anthema was as follows:

"Where's my lovely parsley, say?
My violets, roses, where are they?
My parsley, roses, violets fair,
Where are my flowers? Tell me where."

FLOWER-DE-LUCE. See **IRIS**.

FLOWER OF COURTESY, THE. A poem attributed to Chaucer by Tlynne. The preponderance of evidence, however, points to John Lydgate as the author.

FLOWER PECKERS. A book name for a rather indefinite group of small, brightly colored East Indian birds, sometimes called honey peckers, of which the Australian *Dicaeum* is regarded as a type. They have many characteristics of the creepers, but are provisionally set apart into a family Dicaeidae.

FLOWERPOTS. Receptacles of unglazed earthenware, tapering a little towards the bottom, which is perforated with one or more holes. (See **POTTERY**.) Those of smallest size are only about two inches deep and are used chiefly for seedlings to be soon again transplanted. For plants which require a pot of more than 12 inches deep and 18 inches wide, wooden boxes or tubs are generally provided, although earthen pots of much larger size are sometimes made. The flowerpot is usually placed in a saucer of the same material, but when plants growing in flowerpots are placed out of doors the saucer is often dispensed with. For ornamental use

flowerpots are sometimes glazed, or made in the shape of vases. In filling flowerpots small stones or bits of broken pottery are placed in the bottom, to prevent water from lodging there and souring the soil in which the plant is to grow.

FLOWERS. A term applied by the older chemists to any light pulverulent substance obtained by sublimation, as flowers of antimony, flowers of arsenic, flowers of benzoin, flowers of sulphur, flowers of zinc, etc.

FLOWERS, ARTIFICIAL. Copies of natural flowers made of a great variety of materials and used for both scientific and decorative purposes. To the former class belong the collection of flowers in the possession of Harvard University, which are made wholly of glass and illustrate the flora of the United States. Flowers and leaves of painted linen, and of horn shavings stained in various colors, were made by the ancient Egyptians, and it is said that Crassus of Rome made such artificial flowers of gold. The Chinese form beautiful flowers out of rice paper and from the pith of a kind of bamboo, while the Japanese show wonderful dexterity in reproducing the forms and colors of natural flowers. The natives of the Bahama Islands and other savages arrange small and daintily tinted shells into sprays of flowers. Feathers have long been made into beautiful flowers by the South American Indians. In Italy the cocoons of silkworms are dyed and used extensively for this purpose. Fine imitations of flowers are made from paper, especially crape paper, ribbon, velvet, and the thin laminæ of whalebone. Wax-flower making is a distinct branch of the art. At one time the making of wreaths of flowers out of locks of hair, the gifts of friends, cleverly woven with wire, was a favorite form of fancy work among ladies. The Italians were the first to bring the art of making artificial flowers to a high state of perfection. At present the chief centres for the manufacture of flowers for the decoration of ladies' bonnets and dresses, for head wreaths and for table and house decoration, are in France and America. French immigrants probably introduced the industry into America. As early as 1840 there were 10 establishments for making artificial flowers in New York City. The United States census of 1849 reported 23 establishments making artificial flowers, with 434 wage earners and a product valued at \$146,120. By 1909, according to the thirteenth United States census, the number of establishments had increased to 225, giving employment to an average number of 4835 wage earners, with an annual output valued at \$9,041,447.

The materials of which the artificial flowers commonly in use are made are silks, cambric, jaconet, and fine calico, besides muslin, crape, and gauze for particular flowers, and satin and velvet for thick petals. The tinting of petals of the best flowers requires some amount of delicacy and skill. In nature the tint of each petal of a flower is rarely uniform; and the best artificial flowers represent the natural variations with great accuracy. The petals of a rose, e.g., are dyed by holding each separately by pincers, and then dipping it in a bath of carmine, and afterward into pure water, to give delicacy of tint; but as the color is usually deepest in the centre, a little more dye is added there while the petal is still moist, and this diffuses itself outward in diminishing intensity.

The whiteness at the insertion of the petal is produced by touching that part with pure water after the rest is dyed. The artificial flowers of trade, however, are colored by no such delicate means. The material of which they are made is simply dyed in uniform color, in sheets, and any variation in tint is effected by a few daubs of the paint brush after the petals are cut out. The aniline dyeing solutions are heated by steam in great copper kettles, into which the material is dipped. The material is then passed through a wringer and stretched upon frames to dry. The next step is to size the material by applying a solution of dextrin and starch evenly to the surface while the cloth is still stretched upon the drying frames. The material is now ready to be cut into the leaves or petals of flowers. This is effected by sharp steel cutters, made of the desirable size and shape. A large stock of these irons is necessary, as special forms and sizes are required for each flower. Ten or 12 sheets of the material of the same color are carefully and smoothly laid in a pile on a leaden block, and the cutter, with a wooden mallet, drives the sharp steel stamp through the pile and repeats the process till the sheets are riddled with holes. The leaves and petals are now passed on to another workman, who presses the veins into them by means of a pair of dies. (See DIES AND DIE SINKING.) A petal is placed in the lower die and the upper die fitted over it. The dies are placed under a press, and a turn of the wheel presses the vein lines into the stiff material.

The next process in shaping is that of "goffering," or "gauffing," by means of which the hollow form is given to petals. For hollowing petals the goffering iron is simply a polished iron ball, mounted on an iron wire in a handle. It is heated and waxed, the petal is placed on a cushion, and the iron pressed against it. A variety of other forms of goffering irons are used, such as prismatic rods and bent wires.

The stamens are made of coarse yellow thread on which corn meal is gummed. The centres of daisies are usually of wool and cotton dyed yellow. Flowers are put together wholly by hand and are built up from the centre; the pistils and stamens are tied in a bunch to a piece of wire; the petals are arranged in order and pasted; then the sepals of the calyx are pasted outside of these and further secured by winding fine thread or silk round the lower parts. Other wires are inclosed with this thread and form the stalk, which is bound round with green tissue paper; and at proper intervals the leaves are inserted by means of fine wires, to which they are bound, the ends of these wires being bound in and incorporated with the stalk and concealed by the green paper, or a green rubber tubing may be used for the stems. Buds are made of taffeta, tinted and stiffened, and stuffed with cotton. When a variation of tint is desired on a petal, it is colored with a brush. The petals are taken directly from the cutter to the artist, who performs his work with great deftness and rapidity. Twenty or 30 petals are spread out on a tray, and the artist touches up one after another with the paint prepared for the purpose.

Besides the flowers copied from nature there is a considerable demand for what are called "fancy flowers," most of which are invented by the manufacturer to use up waste and spoiled fragments originally designed for better pur-

poses. Flowers suitable for mourning are prepared by coating leaves, flowers, etc., with strong gum and then dusting upon them powdered galena. This substance, a sulphuret of lead, is formed naturally in lustrous cubic crystals of a dark-gray color, and however finely it is powdered, the fragments still tend to retain the same shape and surface and thus present a number of flat glittering facets. Consult M. Van Kleeck, *Artificial Flower Makers* (New York, 1913).

FLOWERS, LANGUAGE OF, or FLORIGRAPHY.

The language of flowers is supposed to have been used among the earliest nations; but the Greeks are the first users of whom we have any trustworthy records. They carried it to a very high degree, using flowers as types of everything interesting, public as well as private. The Romans also had a well-developed flower language, and its study was revived during the Middle Ages, when chivalry became preëminent; and it received great development at the hands of the Roman church. Flowers have had an important part in all mythologies. Oak was the patriot's crown, bay the poet's, and the myrtle the crown for beauty. The olive was the token of peace, as the ivy was the emblem of Bacchus. The significance of many flowers is derived from their properties. The amaranth has been selected to typify immortality because of its duration. The rose, by universal suffrage made the queen of the flowers, has a symbolism varying with its color: a single red rose signifies "I love you"; the small white bridal rose typifies happy love; and the moss-rose bud a confession of love. The following are some well-known flowers, with their symbolism as used in poetry:

Anemone—Fralty, anticipation.	Goldenrod—Encouragement.
Apple blossom—Preference.	Heliotrope—Devotion.
Buttercups—Riches.	Honeysuckle—Fidelity.
Calla—Magnificent beauty.	Hyacinth—Sorrow.
Candytuft—Indifference.	Lilac—Fastidiousness.
Cowslip—Youthful beauty.	Marigold—Contempt.
Daffodil—Unrequited love.	Lily—Majesty, purity.
Dandelion—Coquetry.	Narcissus—Self-love.
Forget-me-not—True love.	Pansy—Thoughts.
Foxglove—Insincerity.	Poppy—Oblivion.
Geranium—Deceit.	Snowdrop—Friend in need.
Gentian—Virgin pride.	Sweet William—Gallantry.
	White violet—Modesty.

Consult S. J. B. Hale, *Flora's Interpreter* (4th ed., Boston, 1835), and Charles Welsh, *The Language, Sentiment, and Poetry of Flowers* (New York, 1912).

FLOWERS, NATIONAL AND SYMBOLICAL. The use of flowers as symbols began in very early times and has continued to the present day among nearly all nations. Biblical literature contains many allusions to floral symbols, and China once possessed a complete floral alphabet. At the present day the Chinese make a lavish use of flowers in many of their public and religious ceremonies, on occasions of marriage, death, and burial, as well as in the decoration of the temples of their deities, the graves of their dead, and their private dwellings.

The monuments of Egypt and Assyria also have upon their surfaces a code of floral calligraphy whose meaning can now be but dimly guessed. Here the sacred lily, or lotus, of Egypt plays a prominent part. It was consecrated to the gods and became in time the national emblem. The Egyptian deity Osiris (q.v.) is portrayed with his head crowned with this blossom; it is painted on the walls and carved on the doors of the temples. See LOTUS.

India had in her magnificent flora a wonderful field for poetical genius. In India the lotus was, as it is now, the sacred flower. In its bosom Brahma was believed to have been born; and it is to the Hindus the chariot of their Cupid, whom they picture as first seen pinioned with flowers and floating down the sacred Ganges upon it. The lotus became, through its association with religious rites, an emblem of mystery and was hence frequently used for architectural adornment. Among the Hindus distinguished strangers are welcomed with garlands of flowers as tokens of hospitality, and the shrines of the favorite deities of the Hindus are decorated with these emblems.

In Persia a yearly festival is held called the "feast of roses," which lasts as long as the roses bloom. The literatures and the languages of the Hindu, Turkish, Persian, Arabic, and Malay races abound in floral symbols. In Japan the lotus is a symbol of purity. The Japanese picture their deity reclining upon the leaf of a water lily or lotus and often name their children after beautiful flowers. The chrysanthemum, or "golden flower," is the national emblem, and the country is popularly called the "Land of Chrysanthemums," and a day is yearly set apart in that country, in November, for the "festival of chrysanthemums." (See JAPAN, *Flora*.) From early days there have been two royal crests in Japan: one is the paulownia tree, which is seen only on the seals of the Emperor's family; the other, the chrysanthemum, which is used for all governmental symbols outside the palace. The flower is embroidered on their flags and banners and printed on important papers. It is stamped on their silks and has decorated their finest porcelain for hundreds of years. Cherry blossoms, too, figure largely among the Japanese. See RISING SUN, ORDER OF THE.

European florigraphy had its rise in Greece and many of the old floral customs still linger in the Grecian islands. The Greeks seem not only to have entertained the most passionate love for flowers, but to have adopted them as typical of every interesting occurrence, public or private. Wooers decorated the doorways of their beloved ones with garlands of flowers; the illness of the inmates was indicated by buckthorn and laurel hung across the lintels; while at death parsley was sprinkled over the remains, and the head was crowned with various symbolical flowers. At the public games of Greece the victor was invariably rewarded with some floral emblem. The Olympian winner received a garland of wild olive (see OLIVE); the Pythian victor received a laurel crown. In the Nemean games a crown of parsley was awarded; in the Elean, a crown of pine leaves. The youths crowned themselves with flowers in the fêtes, the priests in religious ceremonies, and the guests in convivial meetings. Garlands of flowers were suspended from the gates of the city in times of rejoicing. The conventional epithet of Athens was "the city of the violet crown," the violet being chosen as the national emblem. Consult: Gulick, *The Life of the Ancient Greeks* (New York, 1902); Ogle, "Laurel in Ancient Religion and Folk-Lore," in *American Journal of Philology*, vol. xxxi, pp. 287-311 (New York, 1910); "The House-Door in Greek and Roman Religion and Folk-Lore," ib., vol. xxxii, pp. 251-271. See ADONIS; FLOWER DANCE.

The highest honor that a Roman soldier could

receive was the civic crown made of oak leaves. For this and other honorific crowns used by the Romans, see CROWN. The Latins instituted a festival in honor of Flora in 238 B.C., according to tradition, during the reign of Romulus; but the public games, or *Floralia*, were not regularly established until 178 B.C., when it was ordained that the feast should be annually kept on the 28th day of April, lasting five days. Among the Latins, as among the Greeks, flowers were used as symbols on all public occasions. At marriages the bride wore a wreath; the doorposts of the bridegroom's house were adorned with flowers, birth was heralded by them, and the bier of the dead was strewn with them.

In the Iberian Peninsula floral symbolism is principally indebted to Roman Catholic legends for the little vitality it there possesses. When Moorish power in Spain had been crushed, and Ferdinand and Isabella entered Granada, the pomegranate, the device of Granada, was emblazoned on the arms of Spain and became the national emblem. In France the language of flowers has many votaries, and a lavish use is made of flowers in public ceremonies and as a means of expressing various sentiments. The authentic use of the *fleur-de-lis* as the national emblem of France dates from King Louis VII. When setting out on his crusade to the Holy Land, he chose this flower for his badge. The French flag had, from 1376 on, a cluster of the *fleur-de-lis* upon its face, but they were replaced by Henry IV (1553-1610) with the single *fleur-de-lis* on a blue ground, which was the design on the old French flag. This flower is seen carved upon the royal palaces and public buildings of the French, woven in their tapestries, engraved upon their plate, and stamped upon their wares. Napoleon I upon becoming Emperor of France changed the emblem to the bee, but the lily was afterward restored. The violet was also adopted as the badge of the Bonapartists in France after the banishment of their leader to Elba, its signification being "to return in spring." Flowers have not seldom been used as the badges of partisans in other countries; thus, in the long struggle between the Imperialists and the Pope during the twelfth century, the white lily was the party badge of the Ghibellines, while the Guelphs wore the red lily. See GUELPHS AND Ghibellines.

The cornflower, or *Kaiserblume*, may be considered the national flower of Germany. When Louise, the mother of Emperor William I, was forced to take refuge with her small family in the outskirts of the city of Berlin while Napoleon's army was occupying the city, the children cried from hunger and exposure. In order to pacify them the beloved Queen-mother gathered the cornflowers growing by the wayside and wove them into garlands; from that time this blossom was the favorite flower of William and his people.

The national emblem of England, the rose, is of historic interest. Edward I wore the red rose, as did his brother Edmund Crouchback of Lancaster. John of Gaunt took a red rose on his marriage with Blanche, heiress of Lancaster; and his younger brother, Edmund Langley, Duke of York, adopted the white, which he handed down to his descendants. The wars known as the "Wars of the Roses" afterward waged between Henry VI of Lancaster and Edward IV of York, for possession of the crown

of England, gave a deeper significance to these badges; but the marriage of Henry VII of Lancaster with Elizabeth of York, eldest daughter of Edward IV, united forever the rival houses and ended the civil war. (See ROSES, WARS OF THE.) The two roses then became united under the title of the Tudor Rose, which was made the national flower. The rose has been termed the "flower of flowers." The ancients regarded it as the emblem of silence, of love, and of joy. Cupid was frequently represented as offering a rose to Harpocrates, the god of silence. On festal occasions a rose was suspended over the table, intimating to the assembled guests that the conversation was to be literally as well as metaphorically *sub rosa*, or "under the rose." The name Plantagenet is said to have arisen from the fact that Geoffrey of Anjou wore sprigs of the broom plant (*planta genesta*) in his cap.

In the reign of Malcolm II of Scotland (1010) the country was invaded by the Danes, who attempted to storm an important fortress on the most eastern point of Scotland. Their preparations being completed, and the night well advanced, they approached the castle stealthily, removing their shoes. Upon reaching the moat they plunged in, expecting to swim across. Suddenly the air resounded with cries of rage and distress; for the moat was filled with thistles, not with water. Thus the inmates were aroused to a sense of their danger, and Scotland was saved. Out of gratitude for their escape the Scots adopted the thistle as their national emblem, with the appropriate motto, *Nemo me impune lacessit*. See THISTLE, ORDER OF THE.

St. Patrick, the patron saint of Ireland, while preaching one day was at loss to explain the doctrine of the Trinity. The people failed to understand and refused to believe that "there could be three Gods and yet one." The preacher paused and, stooping, plucked a shamrock growing at his feet. "Do you not see," said he, "in this wild flower how three leaves are united on one stalk, and will you not then believe what I tell you, that there are indeed three persons and yet one God?" By this simple means his audience was enabled to comprehend his meaning, and at once embraced the doctrine. From that time this flower became the national emblem of Ireland.

It is recorded that on St. David's Day, March 1, 640 A.D., the Welsh, under Caedwalla, were about to march against an English army. To distinguish themselves from the enemy, they adopted the badges most easily obtained; each man plucked a leek from the field through which he was passing and stuck it in his cap. The Welsh arms were victorious, and the leek was adopted as their national emblem in grateful memory of this event. It is worn by loyal Welshmen on every anniversary of St. David's Day.

Mexico has chosen the nopal cactus, or prickly pear, as her national emblem. The design on the Mexican coat of arms is an eagle, holding a snake in its beak, perched upon a cactus stem. It is said that, after the Aztecs had wandered for many years, a wise man told them that, when they reached a place where they found an eagle perched upon a rock, there they should build their city. As they drew near Lake Tezcuco, they saw an eagle perched upon a branch of the nopal growing out of a rock. Here they built their city, giving it a name meaning "Nopal on a stone."

In England, ever since the death of Lord Beaconsfield (1881), the primrose has been adopted as the badge of the Conservative party, in the belief that it was the favorite flower of their great leader. This belief is said to be a mistaken one and to have originated in an incident that happened at the time of his funeral. The Queen sent a mass of primroses on that occasion with the inscription, "His favorite flower," meaning her own husband, Prince Albert. It was, however, understood as referring to Lord Beaconsfield, so that on the anniversary of his death (April 19) every Conservative now wears a bunch of primroses, and the day is known as Primrose Day. See PRIMROSE LEAGUE.

The United States cannot be said to have a generally accepted national flower. In 1889 an attempt was made to secure a general expression of opinion in favor of some one flower, and the goldenrod, as being indigenous and more widely distributed than in any other country, received the majority of the suffrages; but a national flower is usually recognized only when tradition and legend give it significance and not because of a popular vote. By acts of the Legislature some States have adopted State flowers: Iowa, the wild rose; Maine, pine cone and tassel; Michigan, apple blossom; Montana, bitter root; Nebraska, goldenrod; Oregon, Oregon grape; Vermont, red clover; Colorado, white and blue columbine; Oklahoma, mistletoe; Utah, sego lily. In other States flowers have been selected by vote of the school children, or for other reasons are popularly recognized: California, the California poppy; Idaho, syringa; Kansas, sunflower; Minnesota, moccasin flower; Nevada, sagebrush; Washington, rhododendron; Georgia, Cherokee rose; New York, goldenrod. Consult: *Flowers of History, Especially such as Relate to Britain, from the Beginning of the World to the Year 1307*, by Matthew of Westminster (2 vols., London, 1853); Folkard, *Plant Lore* (ib., 1884); Haig, *The Floral Symbolism of the Great Masters* (New York, 1913).

FLOWERS AND INSECTS. The dependence of insect life on that of plants is illustrated by the fact that in Germany between 500 and 600 species of insects obtain their livelihood by feeding upon the oak, while in the United States nearly the same number of species have already been found to prey on the native oaks. The elm, willows, and pines also afford food and shelter to hundreds of species, the insect pests of the apple and other fruit trees also amounting to many hundred species each. Some insects bore in the roots; multitudes of borers penetrate into the trunk, branches, and twigs, as well as bark; while still greater numbers of caterpillars feed upon the leaves. The result of the life within the tree—in the wood or bark, or in veining the leaves—is very marked, as the borers are profoundly modified in various ways. Many borers, in consequence of their peculiar mode of life, have long, often flattened, bodies, are eyeless, and have lost their limbs, in part or wholly, through disuse, while their jaws, by which they eat their way through the wood, are enlarged and otherwise adapted for their lignivorous habits. The manifold adaptations of the larvæ of beetles, as seen in thousands of species, afford admirable examples, in the opinion of Lamarckians, of the effects upon a plastic organism of strains, stresses, and of use and dis-

use, in the production of the form of the body. It may be said in general that as soon as land plants, more or less treelike in habit, however low or primitive in character, appeared (such as the treelike club mosses and allied flowerless forms of the Devonian and Carboniferous periods), a new world hitherto unoccupied was opened up to insect life, of which the insects speedily took advantage.

The earliest insects, as cockroaches, locusts, and the like, fed on dead leaves or herbaceous plants; others were aquatic and carnivorous. But as soon as plants became treelike and grew in vast forests, new habitats were opened up, of which the insects immediately took advantage. It will thus be seen that the intimate relation between plants and insects must have taken place very early in geological history.

Effects of Flowers in Modifying Insects. Coming now to consider the mutual relations and dependence of insects and flowers, we will first take up the subject of the adaptation of insects to feeding on the pollen or nectar of flowers. A few insects, some beetles and certain caterpillars, may devour the petals of flowers; but the chief attraction lies in the pollen or the nectar, and as the result we shall see that insects visiting flowers for the purpose of feeding upon their floral products are remarkably modified for this purpose. Hermann Müller has shown the way in which insects are fitted to obtain their floral diet, how many characters of flowers and of their visitors "have been developed in reciprocal adaptation, and which can therefore only be understood when considered together."

The insects which feed on pollen or nectar, and thus fertilize flowers, are certain bugs, beetles, flies, most moths and butterflies, wasps, and bees. It should be noticed that none of the primitive, generalized, or net-veined insects are included among these floral visitors. They contented themselves, as they do now, with the rank growth of herbaceous plants.

The true bugs (order Hemiptera) have the mouth parts formed into a long beak adapted for piercing the flesh of animals or the leaves or stems of plants. But some of them (*Anthrenus*, etc.) are fitted by their small size to creep into and suck honey from many different flowers. Minute insects of another group (*Thysanoptera*) are constantly found in flowers of all sorts, where they feed both on pollen and honey. Müller says they seize a single pollen grain in their jaws and convey it to the mouth; they obtain honey by applying the mandibles and maxillæ together so as to form a short, conical sucking apparatus. Their jaws and accessory jaws (maxillæ) are long and narrow, tapering to a sharp point, and here again we have long, slender, beaklike mouth parts adapted for probing flowers.

The modifications of the maxillæ (jaws) of certain flower-visiting insects, adapting them in some cases for playing the part of butterflies and bees, are remarkable. Leaf-feeding beetles, such as chafers and chrysomelids, do much harm by devouring petals or entire flowers, but there is no resulting modification. "A review," says Müller, "of the mode of life of insects which visit flowers, and of the families to which they belong, shows continuous gradations from those which never visit flowers to those which seek them as a secondary matter and finally to those which entirely depend upon

them." In the great group of longicorn beetles (Cerambycidae), in which the head is generally short, the jaws are directed downward, so they can use them in biting the bark of trees in order to oviposit in it. There is a group (Lepturidae) which frequents flowers. These have the head lengthened out in front, a necklike constriction behind the eyes, and consequently the power to direct the mouth forward while the prothorax is elongated and narrowed in front; besides this, the lobes of each maxilla are furnished with a brush of hairs. All these departures from the normal type and customary habits are the result of a process of adaptation to a floral diet. Müller attributes this to natural selection, but one will readily perceive that this view is not practical nor adequate. There may be another point of view. As this type of beetles multiplied and ordinary food became scarce, competition set in, necessities of existence drove the insects to the unusual diet of pollen and honey, and probably the body became modified as the

MAXILLA OF NEMOGNATHA.

1. Maxilla (entire), showing the prolonged galea. 2. Enlarged view of basal part of maxilla, to show the taste papillae (tp), and cups (tc) on the galea (ga); n, nerve—a ganglionated nerve supplies each taste papilla, or cup; l, lacinia; p, palpifer; s, subgalea. 3. Part of end of galea, more enlarged to show the imperfect segments and the taste organs. (Henslow.)

result of constant effort in straining after the nectar at the bottom of flowers, and the creature became long-necked, long-headed, and its tongue-like maxilla especially adapted for brushing off and collecting grains of pollen. The case reminds one of the probable series of causes which led to the formation of the long neck and slender head and tongue of the giraffe.

Other beetles gather pollen, and their mouth appendages are adapted in accordance with this habit, while among certain families (e.g., Mordellidae, Edemeridae) all the species in a perfect state depend entirely on a floral diet. The most remarkable of all beetles adapted for sucking honey is the flower-visiting *Nemognatha* (which means "threadlike jaws"), in which the galea of each maxilla is of enormous length, so that the two together form a rude sucking tube, roughly comparable with the tongue of the butterfly. It is believed to be very sensitive, as it contains many taste cups. Here we see carried out almost to excess the idea of a tongue adapted for probing deep corollas. It is a case of convergence, where the action of similar ef-

forts and mechanical strains have gradually resulted in structures of the same form in insects belonging to entirely different orders.

Flies. The majority of the flies (Diptera) resort to flowers for the little food they require in the imago state. And here the mouth parts are very different in structure from those of biting insects, the long proboscis being a modification of a portion of the labium, representing the tongue, or "lingua," of other insects. The beautiful yellow, wasplike drone flies (Syrphidae), so abundant about flowers and so important as fertilizers, depend mainly or exclusively on a floral diet; and here, as Müller states, "are found the most perfect adaptations to a diet alternately of pollen and honey." The complicated proboscis ends in two broad flaps. These flaps are "admirably adapted for seizing the pollen, for grinding it down, and for passing it backward, the apposed surfaces of the two flaps being closely set with parallel ridges of chitin, by which the pollen grains are easily held fast and shoved into the entrance of the groove. Diptera, like the house and allied flies (Muscidae, also the Stratiomyidae), visit flowers to obtain both pollen and honey. These flaps are wanting in other flies, as the mosquito, and in the Bombyliidae, which have enormously long tongues, as well as in other families (Empidae and Conopidae), and these flies visit flowers, probing them for the honey alone. Now, in these flies the head itself is not especially modified, but in *Rhingia* the head is developed into a long snout, the tongue being longer than the whole body. This fly (one of the Syrphidae) is remarkably intelligent, probing the deeply hidden nectary of the iris and many other flowers. The species of *Empis* carry their long, thin, straight proboscis directed downward; hence they chiefly resort to erect flowers, into which they can plunge their proboscis vertically. In all these flies there is great variation in the shape and degree of specialization of the mouth parts, these being in intimate relation with the habits of these highly specialized insects.

Hymenoptera. Still better adapted than the flies are the wasps, and especially the bees, which rely almost exclusively on a floral diet and are most important as fertilizers of flowers. In bees (q.v.) the mouth parts are wonderfully adapted for probing flowers, the maxilla being specialized in a variety of ways, while with its stout mandibles the bumblebee can cut a hole through the corolla of salvia or wistaria without taking the trouble, as the honey bee does, to seek out the nectary. Besides the mouth parts, the hairy legs, especially those of the hinder pair, are so modified as to form pollen baskets (corbicula), in which the pollen is heaped, or the bristly hairs on the underside of the hind body of the leaf-cutter bee are adapted for this purpose, while the hairs on most bees are "spinulose," or stiffly feathered, for the purpose of carrying the pollen dust—all of which means of obtaining and carrying pollen are of direct importance in the fertilization of flowers. All these highly complex structures have evidently been brought about in response to the complicated series of muscular efforts and physical strains resulting from the attendance of these insects upon flowers.

The perfection of adaptation is attained in the moths and butterflies. These creatures and birds are clearly the most highly and wonderfully specialized of all animals. The butterfly

is a most delicate and elaborate living flying machine, and all its characteristic structures have been drawn out in response to its mode of life, and of all the organs its spiral tongue is the most marvelous in mechanism and adaptation. That the tongue (maxillæ) has been evolved in response to the visits to flowers with a deep corolla is, among other facts, suggested by that of its entire absence in many silkworm moths. These sluggish, short-lived insects do not take liquid food, consequently by disuse the tongue is either in part or in certain forms entirely atrophied. The steps in development and specialization of the tongue of Lepidoptera, which is adapted for probing either flat or long and tubular corollas, may easily be traced. The end of the tongue is sometimes highly specialized. "Peculiar stiff, sharp-pointed appendages at the end of the laminae enable them also to tear open delicate succulent tissues and make use of the sap in flowers which secrete no honey." In response also to severe impacts and strains the tip of the tongue of certain moths (*Ophideres*) is so spiny that it can pierce the skin of plums, peaches, and even oranges. In length the tongue may vary from a minute pointed rudiment scarcely a millimeter in length to that of the hawk moths, which may be 80 millimeters long, while in a Madagascar sphinx the tongue is $9\frac{1}{4}$ inches in length, and as there are said to be orchids with flowers as deep as this, there is evidently a relation of cause and effect between the phenomena.

Origin of Floral Structures Through Insect Agency. Having seen that insects have been highly modified in various ways by the use and disuse of organs, while seeking pollen and nectar, we may now inquire into the result of such visits or stimuli upon the flowers themselves. Many facts and ingenious suggestions have been made by Henslow in his *Origin of Floral Structures*. His conclusion is that a flower with a conspicuous corolla or perianth has originated from "a leaf bud of which some of the members have already differentiated into carpellary, others into staminal organs, the outer appendages being simply bracts, like, we will say, those surrounding the stamens or ovule of the yew." Insects probably visited the primitive flowers for pollen, but also pierced the juicy tissues for moistening the honey. Gradually the nectar was evolved, and after a time, the earliest-formed flowers having attracted insects to come to them regularly, a numerous series of differentiations would result. The corolla, in all probability, would be the first to issue out of the tracts. Other changes would follow by degrees and in different combinations. From regular, irregular flowers like those of the pea would arise. But all such changes "would be due to the responsive action of the protoplasm, in consequence of the irritations set up by the weights, pressures, thrusts, tensions, etc., of the insect visitors. Thus, then, do I believe that the whole floral world has arisen."

Irregular flowers, as that of the pea, have been made such by the visits of the bees and other external influences. When a flower is situated laterally and projects horizontally, or nearly so, an insect is compelled to alight upon it on one side only, when approaching it directly from the front. It then throws all its weight upon the organs on the lower or anterior side of the flower, as is the case with the keel petals of papilionaceous flowers, with the lips of labiates,

etc.; or else its weight is sustained by the stamens or style, or by both together, as in *Epilobium angustifolium*, *Circea*, veronica, larkspur, and monkshood; and whenever the stamens are declinate, as in horsechestnut, *Dictamnus*, *Echium*, amaryllis, etc. Henslow assumes that the primary cause of irregularity must come from without, from an insect—i.e., from the mechanical influence of its weight and pressures. "To this external irritation the protoplasm of the cells responds, and gives rise to tissues which are thrown out to withstand the strains due to the extraneous pressures of the insect, and so the flower prepares itself to maintain an equilibrium under the tensions imposed upon it, and irregularities are the result. Such modifications occur in the bilobed calyxes of furze and salvia, with many forms of lips, and in enlarged anterior petals or in dependent stamens, as those of aconite and *Epilobium*. The lip of *Lamium* consists of one much enlarged petal, which forms an excellent landing place for a bee to rest upon, while the two lateral petals, not being required, are atrophied to mere points. In like manner the two posterior petals are enlarged to form the hood, presumably due to the backward thrust of the insect's head." In the irregular flowers of the foxglove and the gloxinia, as well as petunia to a slight extent, and in the regular campanulate flowers, the tube of the gamopetalous corolla "has enlarged so as to permit the ingress of an insect which partly or entirely crawls into it; then it is this tubular part which, more especially having to bear the strain upon it, bulges outward or becomes more or less inflated in form, while the lip or anterior petal, not having to bear the entire burden, is not particularly enlarged, if it be at all." Henslow states that if no more than the head of an insect enter the flower, "then the corolla shapes itself to fit it"; thus the snowberry, *Scrophularia*, and *Epipactis* only admit the heads of wasps, which are the regular visitors of these flowers. How the deep tubular corolla of the evening primrose

DAVERNOIA ADHATODOIDES.

a, the flower, an example of an irregular corolla adapted to the needs of its insect visitors; b, appearance when entered by a bee. "The weight of the bee must be very great, and the curious shape of the lip with its lateral ridges is evidently not only an excellent landing place, but is so constructed as to bear that weight. Moreover, the two walls slope off and are gripped by the legs of the bee so that it evidently can secure an excellent purchase and thus rifle the flower of its treasure at its ease." (Henslow.)

or the honeysuckle has been brought about is explained by the fact that butterflies, in probing their depths while on the wing, irritate the tube only, "which thus elongates and contracts, resulting in little or no irregularity in the flowers." Also flowers like the narcissus and evening prim-

rose prevent the ingress of short-tongued insects. The origin of irregular flowers is illustrated by *Davernioia adhatodoides*, whose curiously shaped lip affords an excellent landing place for a big bumblebee; "moreover, the two walls slope off and are gripped by the legs of the bee, so that it evidently can secure an excellent purchase and thus rifle the flower of its treasure at its ease." The immediate cause of the shape of the wing petals of many papilionaceous flowers is attributed to the "weight of the insect in front, the local irritations behind, due to the thrust of the insect's head in probing for nectar, coupled with the absence of all strains upon the sides." Good examples of the occurrence of great thickening of the tissue just where the strain will be most felt are to be seen in the slipper-shaped flowers cypripedium, calceolaria, etc.

If the reader will turn to the article KINETOGENESIS, he will see how exactly parallel are the cases cited with those mentioned for plants by Henslow. In part he says: "In alluding to the above instances of levers and mechanical powers in plants, one mentally recalls how abundant they are in the distribution of the bones and muscles in vertebrates. I cannot help thinking, therefore, that the old view was fundamentally correct; that such have been gradually brought into existence by the efforts to meet the strain put upon them. If this be true, then one and the same law has prevailed in the evolution of organs in both the animal and vegetable kingdoms."

The accompanying figure explains how the forms of the calyx and corolla are adjusted to bear the weight of the insect. The bee, he says, alights on the lip and then partly crawls into the expanded mouth of the corolla, so that its weight now lies in the direction of *w*. The fulcrum will be at *f*, and the resultant of these is in the opposite direction to *r*. This is where the strain will be felt; "so that it is just at this point where the backward curvature takes place which gives strength to the corolla tube. This latter is greatly supported by the tube of the calyx, which, as stated, has a curiously thickened cylinder within the mesophyl."

LAMIUM.

A flower of *Lamium album*, showing distribution of forces under insect visitation: *w*, direction of pressure from the insect's weight; *f*, fulcrum; *r*, resultant, opposite to the direction of *r*.

Other structures, as projecting hairs, are so situated as to form obstructions to the entry of small insects which would be unable to pollinate the flower. In the gentian there are toothlike processes at the entrance of the corolla; in the Indian pipe and a *Daphne* a large circular stigma nearly blocks up the tube. Insects have been repeatedly observed to lick the various parts of flowers, and thus maintain an intermittent irritation and consequent formation of hairs and other products. Müller has often watched a fly (*Rhingia rostrata*) licking the staminal hairs of a *Verbascum*, and in many cases the hairs on the filaments offer a foothold to the insects while visiting the flowers, as in the mullein; such hairs, Henslow claims, "being the actual result of the insects clutching the filaments or rubbing them with their claws."

The chief attraction of flowers to insects is of course their honey glands, or nectaries, and these are thought by Henslow to have originated from

the visits of insects which, at first attracted to the juicy tissues of flowers, "by perpetually withdrawing fluids have thereby kept up a flow of the secretion which has become hereditary, while the irritated spot has developed into a glandular secreting organ." These spots occur at different places in different flowers, "wherever the prevailing insect found it convenient to search." On the other hand, nectaries disappear when the whole flower degenerates and becomes regularly self-fertilizing or else anemophilous, so that insects do not visit them. Henslow even suggests that the insectivorous pitchers of *Nepenthes* may have been due to the external irritation caused by insects, for Sir J. D. Hooker had already shown that they originate from water glands. The continuous flow of nectar has its analogy in the daily regular, though intermittent, mechanical irritation, and its inherited effects, which keep up the secretion of milk in the goat and cow. Ants play their part in bringing about changes in what are called, for this reason, "ant plants." The hypertrophied stipules or thorns of *Acacia*, and the stems of *Myrmecodium*, as shown by Beccari, are due to the irritation set up by these insects, which bring about a hypertrophy of the cellular tissue. A small swelling appears on the tigellum of *Myrmecodium*, serving the purpose of a reservoir of water, which only grows larger through the agency of ants. Henslow also attributes the large honey pits at the base of the leafstalks on *Acacia sphaerocephala*, as well as the terminal "fruit bodies" occurring on the tips of the leaflets, to the same cause—viz., the mechanical irritation of the ants.

Colors. The colors of flowers are primarily due to nutrition. The particolored spots and streaks leading down into the bottoms of flowers, called "guides" and "pathfinders," invariably lead to the nectaries, and these effects seem directly due to the visits of insects. "The guides," says Henslow, "like obstructing tangles of hair and nectaries, are always exactly where the irritation would be set up, and I take them to be one result of a more localized flow of nutriment to the positions in question. Instead, therefore, of a flower having first painted a petal with a golden streak to invite the insect, and to show it the right way of entering, the first insect visitors themselves induced the flower to do it and so benefited all future comers." The facts and theories suggested by the colors of flowers are further borne out by the geological history of fossil flowering plants and of those orders of insects containing flower-visiting forms. In the Paleozoic age there were, so far as yet known, no flowers, nor any moths, flies, ants, or bees. The first flowering plant, the screw pine, appeared in the Permian, but its flowers were greenish and inconspicuous. Early in the Mesozoic age more modern plants appeared, and by this time the most primitive beetles, moths, and hymenopterans probably arose, although the traces discovered are very scanty. But at the opening of the Upper Cretaceous vast forests of deciduous trees clothed the uplands, while in the jungles, in the plains, and in the openings of the forests true flowers abounded, since fossil composite blossoms, like the sunflower, occur in the Upper Cretaceous clays of New Jersey. Now the remains of moths, butterflies, many flies, ants, and bees abound in the Middle Tertiary, and undoubtedly their fore-runners existed in the Cretaceous, so that we are

justified in assuming that flowers and the insects which visit them were nearly simultaneously brought into existence, and from all that has been said it is a reasonable theory to advance that the forms of flower-visiting insects were the result of the presence of flowers, and that flowers have been modified from small greenish forms of inflorescence into the beautiful creations which now deck the fields and adorn our gardens.

FLOWERY KINGDOM, THE. A name for China.

FLOWING WELLS. See ARTESIAN WELLS.

FLOW STRUCTURE. See IGNEOUS ROCKS.

FLOX ÆRIS (Lat., flower of copper, from *phlox*, Gk. *φλόξ*, flame, flower, from *φλέγειν*, *phlegein*, to blaze, and *æs*, copper). A term applied by the older writers on chemistry to the finely divided powder obtained by pouring water on the surface of freshly melted copper and consisting of the red (cuprous) oxide of copper.

FLOY, JAMES (1806-63). An American Methodist clergyman, born in New York City. He studied at Columbia College and at the Royal Botanical Gardens, London, was a clerk at the Methodist Book Concern, and, entering the ministry in 1835, held pastorates in and around New York. For attending an Abolition convention he was censured by his conference. He was editor of the *National Magazine* and secretary of the Methodist Tract Society (1856-60), editor in chief of the *Methodist Hymnbook* of 1849, edited the posthumous works of Stephen Olin, contributed many articles to the *Methodist Review* and other Methodist periodicals, and wrote: *Bible Morality* (1861); *Lessons in Bible History* (1861); *Old Testament Characters Delineated and Illustrated* (1864); *Occasional Sermons, Reviews, and Essays* (1865). Consult an article in the *Methodist Quarterly Review* (January, 1864).

FLOYD, JOHN BUCHANAN (1807-63). An American politician and Confederate leader, born at Blacksburg, Va. He graduated at the College of South Carolina in 1826, studied law, and practiced his profession at Helena, Ark., from 1836 to 1839, when he returned to his native State and continued his practice in Washington County. In 1847-49 and again in 1853 he served in the Virginia State Legislature, and in 1850 he was chosen Governor of the State, in which capacity he advocated the laying of a tax on the products of States which would not deliver up fugitive slaves owned in Virginia. President Buchanan appointed him Secretary of War in 1857. Here his extraordinary incapacity for an executive office was lost sight of in the more serious grievances arising out of his relations with the leaders of the secession movement. Early in 1858 he began a rather questionable practice of accepting drafts from a firm of

government contractors in anticipation of their earnings. In December, 1860, Floyd, whose resignation had been requested by the President, retired from the cabinet. After the war began he was commissioned a brigadier general in the Confederate service, commanded in some unsuccessful operations in western Virginia, and was senior commanding officer at Fort Donelson. When it was clear that capitulation was inevitable, Floyd fled in the night, together with Pillow, his second in command, and part of their troops, and left General Buckner to surrender to General Grant. (See FORT HENRY AND FORT DONELSON.) Two weeks later Floyd was relieved of his command. Consult: Rhodes, *History of the United States*, vol. iii (New York, 1895); Crawford, *Genesis of the Civil War* (ib., 1887); Davis, *Rise and Fall of the Confederate Government* (ib., 1881); Nicolay and Hay, *Life of Lincoln* (ib., 1890).

FLOYD, WILLIAM (1734-1821). An American patriot, one of the signers of the Declaration of Independence, born at Brookhaven, Suffolk Co., N. Y. On the approach of the Revolutionary War he identified himself with the Patriot party and in September, 1774, was sent as a delegate to the first Continental Congress. He was subsequently a member of the Continental Congress from 1775 to 1777 and again from 1778 to 1783; was a State Senator from 1777 to 1788 and from 1789 to 1791 was a member of the first Congress under the Federal Constitution. In 1794 he removed to Oneida County, then on the frontier; in 1801 was a member of the State Constitutional Convention and in 1808 was again elected to the State Senate. Consult: Sketches in Dwight, *Signers of the Declaration of Independence* (last ed., New York, 1895); Sanderson, *Biography of the Signers to the Declaration of Independence* (Philadelphia, 1828); and an article in the *Magazine of American History*, vol. i (New York, 1877).

FLOYER, SIR JOHN (1649-1734). An English physician and scholar, born at Lichfield, educated at Queen's College, Oxford, and knighted about 1686. He practiced medicine in Lichfield, and it was upon his advice that Dr. Johnson, when a child, was taken to be touched by Queen Anne for "the evil" scrofula. He invented the pulse watch, and his work on asthma was important, as it gives the first description of emphysema of the lungs. His works on other subjects than those mentioned include: *The Touchstone of Medicines* (1687-90); *Preternatural State of the Animal Humors* (1696); *The Sibylline Oracles* (1713); *A Vindication of the Sibylline Oracles* (1715); *Essays on the Creation and on the Mosaic System* (1717); *Medicina Geronomica* (1724); *A Comment on Forty-two Histories Described by Hippocrates in his "Epidemics"* (1726).

FLÜCKIGER, fluk'è-gér, FRIEDRICH AUGUST (1828-94). A German pharmacognosist, born at Langenthal, Switzerland, and educated at Berlin, Bern, Geneva, and Heidelberg. He was president of the Swiss Association of Apothecaries from 1857 to 1866, and professor of pharmacognosy at Bern (1870-73) and Strassburg (1873-92). He was also a member of the commission appointed to revise the pharmacopeia of the German Empire (1881-88). As a writer, also, he exerted a far-reaching influence upon the development of the science with which he was so long prominently identified. Among his chief publications may be mentioned: *Pharmakognosie*

des Pflanzenreichs (1867; 3d ed., 1891); *Grundlagen der Pharmakognosie* (2d ed., 1885); *Pharmacographia: A History of the Principal Drugs of Vegetable Origin Met with in Great Britain and British India*, with Hanbury (1875; 2d ed., 1878); *Pharmaceutische Chemie* (1879; 2d ed., 1888); *Grundriss der Pharmakognosie* (1884; 2d ed., 1894).

FLUDD, ROBERT (1574-1637). An English physician and mystic philosopher, born at Bearsted, Kent. He was educated at Oxford, taking the master's degree in 1598, after which he spent six years in study and travel on the Continent. Having returned to England, he studied medicine, was admitted to practice in 1606, and was elected a fellow of the College of Physicians in 1609. While on the Continent he had become interested in scientific experiments and natural philosophy and maintained a laboratory where he constructed various sorts of odd mechanisms, such as an automatic dragon and a self-playing lyre. Some of his inventions were more useful, and some writers contend that he was the original inventor of the barometer. In 1615 he became interested in the doctrines of the mysterious fraternity of the Rosicrucians (q.v.) and wrote in Latin several elaborate vindications and expositions of it. He also became a follower of Paracelsus and attempted to formulate a system of philosophy based on his teachings and setting forth the identity of physical and spiritual truth. His writings attracted the attention of Kepler, Gassendi, and Mersenne, all of whom considered them of enough importance to demand refutation. Among his published works were: *Apologia Compendiaria, Fraternitatem de Rosea Cruce Abluens* (1616); *Tractatus Apologeticus Integritatem Societatis de Rosea Cruce Defendens* (1617); *Tractatus Theologophilosophicus*, etc. (1617), a treatise in three parts, dedicated to the Rosicrucian Fraternity; *Veritatis Proscenium* (1621), a reply to Kepler; *Philosophia Sacra et Vere Christiana* (1629); *Sophia cum Moria Certamen*, etc. (1629), and *Summum Bonorum* (1629), both replies to Mersenne; *Doctor Fludds Answer unto M. Foster, or the Squesing of Parson Fosters Sponge* (1631); *Philosophia Moysaica* (1638; Eng. ed. *Mosaicall Philosophy*, 1658). Consult Waite, *The Real History of the Rosicrucians* (London, 1887).

FLÜE, flü'e, NIKOLAUS VON (1417-87). A Swiss hermit, whose real name was Löwenbrugger, born near Sächslein in the Canton of Obwalden. He fought in several Swiss wars, married, had a family, and was a man of influence. In 1467 he abandoned his family and became a hermit in a ravine of the Alps called Ranft, near Basel. In 1481, at the Diet of Stans, he saved the Confederation by his plea for union. He was beatified by Clement IX in 1669 and is the patron of the original Swiss cantons. Consult: Ming, *Der selige Eremit Nikolaus von Flüe* (Lucerne, 1861-71); Herzog, *Bruder Klaus* (Bern, 1887); Baumberger, *Der selige Nikolaus von Flüe* (Munich, 1906).

FLÜELEN, flü'el-en (It. *Fiora*). A village in the Canton of Uri, Switzerland, near the southern end of Lake Lucerne. Pop., 1900, 969; 1910, 1084. It is an important military station of the Swiss Republic and is situated at the junction of the Axen and St. Gotthard roads. It is also connected with the more important Swiss cities by rail.

FLUELLEN, flö-él'en. A disputatious and voluble but pugnacious little officer in Shake-

spere's *Henry V.* His strong Welsh accent is one of the humorous elements of the piece.

FLÜGEL, flü'gel, EWALD (1863-1914). A German-American philologist, son of the lexicographer, Felix Flügel (died 1904), and grandson of Johann Gottfried Flügel. He was born at Leipzig, Germany, and was educated at the University of Freiburg and at Leipzig (Ph.D., 1885), where he was privatdocent in 1888-92). In 1892 he became professor of English philology at Leland Stanford Junior University. He was president of the Pacific Coast Branch of the American Philological Association in 1901-02. Besides his contributions to philological periodicals, his publications include *Carlyle's Religiöse und Sittliche Entwicklung* (1887; Eng. trans., 1890); *Sidney's Astrophel and Defense of Poesy* (1889); *Neuenglisches Lesebuch I. (Periode Heinrichs VIII.)* (1895); *Die nordamerikanische Litteratur* (1907); and the *Prolegomena to the Chaucer Dictionary*, i (1911-13). He became editor of *Anglia* in 1889 and of the *Chaucer Lexicon* for the London Chaucer Society in 1891, and he edited *Mitteilungen Beiblatt zur Anglia* (2 vols., 1890-91).

FLÜGEL, GUSTAV LEBRECHT (1802-70). A German Orientalist. He was born at Bautzen, Saxony, was educated in theology and philology at Leipzig, and studied Oriental languages at Vienna, and in Paris under De Sacy. From 1832 to 1850 he was a professor in an academy at Meissen. He published the text of the Koran (1833) which is in most general use in the West. Among his other works are an edition of the dictionary of Hadschi-Chalfa, with a Latin translation (1835-58; published at the expense of the London Oriental Society); *Concordantiæ Corani Arabica* (1842); *Mani, seine Lehren und seine Schriften* (1862); the catalogue of the Oriental manuscripts at Vienna (1865-67); and a *Geschichte der Araber* (1840).

FLÜGEL, JOHANN GOTTFRIED (1788-1855). A German lexicographer, born at Barby, Saxony. He was for a time a merchant and in 1810 emigrated to America, where he made a special study of the English language. Returning to Germany in 1819, he was in 1824 appointed professor of English in the University of Leipzig. In 1838 he became American Consul at Leipzig and in later years was German representative and correspondent of many literary and scientific institutions of the United States. His reputation rests chiefly on his *Vollständiges englisch-deutsches und deutsch-englisches Wörterbuch* (1830; 3d ed., 1848). Another excellent work is *Triglote, oder kaufmännisches Wörterbuch in drei Sprachen: deutsch, englisch und französisch* (1836-40).

FLÜGEL, OTTO (1842-). A German philosopher, born at Lützen. He studied at Schulpforta and Halle and became pastor of the Evangelical Church at Wansleben, near Halle. He took Ziller's place as editor, with Allihn, of the *Zeitschrift für exacte Philosophie im Sinne des neueren philosophischen Realismus* and in 1894 founded, with Rein, the *Zeitschrift für Philosophie und Pädagogik*. His philosophic position supports Herbartian realism, as opposed to Neo-Kantian tenets; but in theology he holds that revelation is necessary to give certitude to the mere probabilities about a first cause, to which philosophy leads. His writings, outside of contributions to the periodicals mentioned, are: *Der Materialismus vom Standpunkte*

der atomistisch-mechanischen Naturforschung (1865); *Das Wunder und die Erkennbarkeit Gottes* (1869); *Die Probleme der Philosophie und ihre Lösungen, historisch-kritisch dargestellt* (new ed., 1906); *Die Seelenfrage* (new ed., 1902); *Die speculative Theologie der Gegenwart* (2d ed., 1888); *Ueber das Seelenleben der Thiere* (2d ed., 1886); *Das Ich und die sittliche Idee im Leben der Völker* (2d ed., 1888); *Ritschls philosophische Ansichten* (2d ed., 1892); *Die Sittenlehre Jesu* (3d ed., 1892); *Ueber die persönliche Unsterblichkeit* (2d ed., 1892); *J. F. Herbart als Philosoph* (1905); *Monismus und Theologie* (1908).

FLÜGELHORN, flu'gel-hörn (Ger., wing-horn). The German name for instruments of the bugle family. The flügelhorn formerly used in the German army was built in the keys of Eb, D, C, Bb, and A. It is now entirely replaced by the cornet. Meyerbeer employs the flügelhorn in his *Robert le Diable*. See **BUGLE**.

FLÜGGE, flu'ge, KARL (1847-). A German hygienist. He was born at Hanover and studied medicine at Göttingen, Bonn, Leipzig, and Munich. He was a lecturer at Berlin from 1878 until 1883, when he was called to the chair of hygiene at the Hygienic Institute in Göttingen. In 1887 he was called to a similar position at Breslau. In 1909 he became professor of hygiene at the University of Berlin. His original researches in the departments of experimental hygiene and bacteriology have found wide recognition. In the well-known work entitled *Beiträge zur Hygiene* (1872), he discusses house sanitation, porosity, and defilement of the soil, and the food distributed in charitable institutions and hospitals. His other works include *Die Mikroorganismen* (3d ed., 1896); *Grundriss der Hygiene* (new ed., 1902); *Ueber das Absolute in den ästhetischen urteilen Langensalza* (1901). In collaboration with Koch, the celebrated bacteriologist, he became an editor of the *Zeitschrift für Hygiene* in 1886.

FLÜGGEN, flu'gen, GISEBERT (1811-59). A German genre painter, born at Cologne. He studied at the Academy of Düsseldorf and then in Munich, where he afterward resided. His manner and subjects are sufficiently indicated by his title, "the German Wilkie," and he was the first German painter to enter into the social ideas of his age. His work abounds in eighteenth-century sentimentalities, but is fair in technique and in the grouping and expression of the figures. Among his best pictures are: "Servants Surprised" (1839); "The Interrupted Marriage Contract"; "The Antechamber of a Prince" (Munich Pinakothek); "The Unlucky Gamester" (Mainz Museum); "The Legacy Hunter" (Hanover Museum); and an historical painting, "The Last Minutes of the King Frederick Augustus II of Saxony."—His son, JOSEPH (1842-1906), genre and historical painter, was born in Munich, and studied at the academy under his father and under Piloty. He afterward traveled in France, England, and Belgium, where he was influenced by Leys. He became professor at the Munich Academy. His best-known works include "The Flight of the Landgravine Elizabeth" (1867), and "Milton Dictating Paradise Lost."

FLUID (Lat. *fluidus*, flowing, from *fluere*, to flow, Gk. *φλύνειν*, *phlyein*, to overflow). A general name applied to liquids and gases. Fluids readily assume the form of the vessel in

which they are contained, a small force being usually sufficient to change the relative position of their molecules. Gases are compressible or elastic fluids, their volume depending on the pressure exerted upon them. Liquids are relatively very much less compressible; but the assumption that liquids and solids are altogether incompressible is erroneous and leads to all sorts of absurd conclusions. The term "fluids" has also been applied to hypothetical substances which were supposed to cause the phenomena of heat, magnetism, and electricity. The luminiferous ether, in which, according to modern science, the waves of light, electricity, and radiant heat are propagated, is also sometimes referred to as a fluid. See **ELASTICITY**; **HYDROSTATICS**; **MATTER**, *Properties of Matter*; **CRITICAL POINT**; **ETC.**

FLUKE (AS. *flōc*, flatfish, Icel. *flōki*, kind of halibut). In ichthyology, a name applied, more commonly in Great Britain than in the United States, to various species of flounders (q.v.). A familiar example is the Scottish bonnet fluke, or brill (*Rhombus lavis*).

FLUKE, or **FLUKE WORM**. The popular name of various trematode worms, especially those which live endoparasitically. They live as parasites of vertebrate hosts, but in their development the young stages are parasitic in mollusks (snails). The name "liver fluke" is especially applied to *Fasciola hepatica* (*Distomum hepaticum*), which is common in the biliary ducts of ruminants, particularly of sheep, in which it produces the disease called rot, often causing great mortality in flocks during wet seasons and on ill-drained lands. It is generally less than an inch in length, of an oval form, its breadth about half its length; flat, in color like the liver in which it exists. It has no eyes nor other known organs of special sense; it is hermaphrodite, and the organs of reproduction occupy a great part of its body; its anterior extremity is furnished with a sucker, and another is situated at a short distance back on the ventral surface, but the terminal sucker alone is perforated and serves as a mouth, by which bile, the food of the creature, is imbibed; the tube which proceeds from it does not, however, become a proper intestinal canal, but soon divides into two large branches and ends in minute ramifications in all parts of the body.

Large numbers of flukes are sometimes found in the liver of a single sheep and of very different sizes, but they do not multiply there, as was formerly supposed. Their eggs, indeed, are produced there in great quantity, but find their way into the outer world to begin a series of transformations which are among the most extraordinary in the whole animal kingdom. The eggs are laid by the parasites in the liver and pass out with the bile, becoming mixed with the intestinal contents and are finally expelled from the body in the feces, hatching in summer in from three to six weeks. The larva is microscopic, club-shaped, covered with cilia, has a boring apparatus at the broad or anterior end, and is capable of moving about rapidly in water. Unless it encounters a favorable host, it seldom lives longer than a day. When an opportunity presents itself, the larva attaches to and penetrates a species of snail—*Limnæa truncatula*, in Europe; *L. humilis*, *L. oahuensis*, and *L. viator* in America. It lodges in the bottom of the pulmonary chamber, loses the cilia, becomes

modified in various other ways, grows and changes into a body known as a sporocyst. Certain cells within the body of the sporocyst become arranged into five to eight masses. These become modified into embryos known as rediæ, which are cylindrical in form and provided with a digestive canal and two stumplike appendages at the posterior end. When they have reached a length of about 0.25 millimeter, they rupture the sporocyst wall, migrate through the tissues of the snail, and finally lodge, as a rule, in the liver of this host. There the redia grows to about $1\frac{1}{2}$ millimeters in length. From certain cells within the body of the redia daughter rediæ may be formed during warm weather, but during cold weather a different kind of stage is formed, known as cercaria. As many as 10 of the former or 23 of the latter may be formed. By this process of reproduction in the snail a single egg may give rise to 1000 cercariæ. The cercariæ rupture the body of the mother and by migrating through the tissues finally leave the snail. The cercaria is about 3 millimeters long, is provided with two suckers, and a tail about twice as long as the body. After leaving its host it swims about for a time in the water and finally attaches itself to a plant and encysts, and the tail disappears. When the cyst is ingested and reaches the stomach of a host, the cyst is dissolved, and the parasite becomes free and migrates to the liver, probably by way of the bile duct.

The group contains a great number of species, infesting in their mature state different kinds of animals, and finding their appropriate place in very different parts of the animal body.

Instances have occurred of the presence of *Fasciola hepatica* and two other species in the human liver and vena portæ; but their influence on the system is unknown; a species of much elongated form, *Schistosomum* (*Gynæcophorus*) *hematobium*, is very common in Egypt, infesting the vena portæ of man and the walls of the urinary bladder, and producing local and afterward general disease; several species have been found in the human eye, but probably through some such accident as in another case has led to the occurrence of the common fluke under the skin of the foot, where it caused a sore. Of all the known species, the Egyptian (*Schistosomum hematobium*) is by far the most harmful to the human body. This species is also remarkable in not being hermaphrodite and in the extreme dissimilarity of the male and female; the female being a threadlike worm, for which a lodgment is provided in a furrow on the ventral surface of the male. See TREMATODA; LIVER ROT.

FLUME (from OF. *flum*, river, from Lat. *flumen*, stream, from *fluere*, to flow). An artificial channel used to convey water for power development, hydraulic mining, and irrigation where an unlined canal is not feasible or a depression must be crossed and a siphon is not practicable. It is most commonly of wood, but may be of steel, while latterly reinforced-concrete construction has been used, especially by the United States Reclamation Service in its irrigation projects. A flume is placed above-ground, often on trestles or other elevated supports to keep it in a nearly level position. See IRRIGATION.

FLUORESCENIN. See COAL-TAR COLORS.

FLUORES/CENCE (named from fluor spar, which possesses this property). When ether

waves are absorbed by a body which they have entered, their energy, as a rule, is distributed throughout the minute particles of the body, and some heat effect is produced, generally rise in temperature. As a result of this, the body will now radiate more energy than before, and in so doing will give out waves in the ether which are called heat waves, i.e., their wave length is long. Thus, a piece of red glass absorbs certain ether waves, among them all the visible ones except those which combine to produce the sensation red in the human eye. The temperature of the glass rises, and it emits ether waves which are too long to affect the sense of sight. There are many bodies, however, in which the energy of the absorbed waves is not spent in producing rise in temperature, and the consequent emission of long heat waves, but is spent in producing the emission of ether waves which are short enough to affect the sense of sight. Thus, if the extremely short ether waves which do not affect our eyes, and which are called the ultra-violet rays, or if the shorter visible rays, e.g., the violet and blue ones, are absorbed by the body, and if, in return for the energy thus absorbed, longer visible rays, such as those in the green, yellow, or red, are emitted, the bodies are said to "fluoresce," and the entire phenomenon is called "fluorescence." This was first observed by Sir David Brewster for an alcoholic solution of chlorophyll. He found that when a beam of sunlight was passed through such a chlorophyll solution the path of the beam was marked by a brilliant red light, although the colors which were absorbed by the chlorophyll were the blue, yellow, and orange. It should be noted here that the fluorescent light, viz., the red color, corresponds to a wave length which is longer than that of the absorbed colors. This same phenomenon was observed by Herschel in the case of a dilute solution of sulphate of quinine. If a beam of sunlight falls upon this liquid, the portions of the surface where the light is incident exhibit a bright blue color, which is confined to the surface layer.

Herschel also observed that if a beam of sunlight, after passing through a cell containing sulphate of quinine, is transmitted through a second cell of the same solution, there will be no fluorescence in the latter. This means that that constituent of sunlight which developed the blue fluorescent color in the first solution was entirely absorbed by it, and that therefore the transmitted light contained no waves which were able to excite fluorescence in the second cell. The property is exhibited in a greater or less degree by a great many substances, including ivory, bone, some kinds of paper, etc. The fact that it is seen in many violet and green varieties of "fluor spar" suggested to Sir G. G. Stokes the name "fluorescence" itself. The law announced by him and called by his name, viz., that the fluorescent light is of longer wave length than that of the absorbed light, is found to be true in general, but in some cases it has been shown that the spectrum of the absorbed and the fluorescent light overlap. This overlapping probably exists to some extent in most cases, but the more intense part of the fluorescent spectrum consists of light whose wave length is greater than that of the absorbed light. Fluorescence is shown most vividly by so-called canary glass, which is glass colored with oxide of uranium; in most kinds of paraffin oil, and by solutions made from the bark of the horse-chestnut tree.

It is thus evident that fluorescence offers a method for the study of ultra-violet spectra, because if, e.g., the solar spectrum be allowed to fall upon a screen which is moistened with some fluorescent substance, the positions of the "Fraunhofer lines" will be conspicuous by the fact that there is no light emitted at those places, whereas other portions of the screen where light is being absorbed will fluoresce.

Almost all fluorescent bodies cease to emit light the instant the incident light is stopped; but others, notably the sulphides of barium, strontium, and calcium, continue to emit their fluorescent waves for some time after the incident light has been cut off. Such bodies are called "phosphorescent," and the phenomenon is called "phosphorescence." It should be carefully noted that this has nothing whatever to do with the ordinary luminosity of phosphorus itself, which is due to its slow oxidation. Consult Preston, *Theory of Light* (London, 1901), and Wood, *Physical Optics* (New York, 1911). See LIGHT; PHOSPHORESCENCE.

FLUORES/CIN. A colorless, amorphous reduction product of fluorescein, having the chemical formula $C_{20}H_{12}O_6$. On account of its neutral quality and green fluorescence it has been used to study the movements of the intraocular fluids. It has recently been applied in keratitis and ulceration of the cornea to define the precise outlines of the lesion and render minute ulcers visible. For this purpose it is employed in 2 per cent solution with $3\frac{1}{2}$ per cent of carbonate of sodium.

FLUORIDES, *flō'or-idz* (from *fluor*). The salts of hydrofluoric acid. See FLUORINE.

FLU'ORINE (from *fluor*). A univalent nonmetallic chemical element, one of the so-called halogens. Its elementary nature was first recognized by Davy, although it was as yet unknown in the free state and remained unknown until 1886, when Moissan succeeded in isolating it from hydrofluoric acid by a process of electrolysis, the anhydrous acid having been made a conductor of electricity by the addition of a certain amount of acid potassium fluoride. Originally Moissan used vessels of platinum, but the operation can be equally well conducted in vessels of copper. Fluorine occurs combined as fluorite, a calcium fluoride; as cryolite, an aluminum-sodium fluoride; and, in smaller quantities, in many other minerals, as apatite, fluorite, topaz, wagnerite, wavellite, yttrocerite; also in sea water, mineral springs, and rivers, as well as in the stems of grasses, and in bones and other animal substances.

Fluorine (symbol, F; atomic weight, 19.0) is a light, greenish-yellow gas of a penetrating and disagreeable odor that has an irritating effect on the eyes and on mucous membranes. It decomposes water, forming hydrofluoric acid with its hydrogen and setting free ozonized oxygen. Antimony, arsenic, boron, iodine, silicon, and sulphur are capable of burning in an atmosphere of fluorine, and many organic substances, such as alcohol, when brought in contact with it, take fire. Hydrogen combines with it, even in the dark, forming the well-known hydrofluoric acid. Even within 20° C. of the absolute zero of temperature, hydrogen (liquid) combines with fluorine (solid) with explosive violence. The liquefaction of fluorine may be effected by passing the gas into a tube surrounded with boiling liquid air. Under ordinary atmospheric pressure liquid fluorine boils at about 185° C.

below the freezing point of water. The powerful oxidizing properties of fluorine would probably be utilized industrially if its production were not so difficult.

Hydrofluoric acid (HF) is prepared by gently heating one part of pure fluorite with about twice its weight of sulphuric acid in a leaden retort, the anhydrous acid thus produced being condensed in a receiver surrounded by a freezing mixture. It is a colorless, mobile liquid that boils at 19.4° C. (67° F.), and solidifies to a white crystalline transparent mass which melts at -92.3° C. (-134.1° F.), and has a powerful corrosive action on organic tissues, producing severe burns on the skin. For commercial use the acid is made by passing the anhydrous vapor directly into a leaden receiver containing water and is then obtained in dilute form. Owing to its corrosive nature, it must be preserved in lead, gutta-percha, or ceresin bottles. The aqueous acid has the property of dissolving glass and is therefore extensively used for etching on glass, e.g., in marking the divisions on a thermometer tube. Unlike hydrochloric, hydrobromic, and hydroiodic acids, hydrofluoric acid exists in ordinary aqueous solutions in the form of double molecules, as if its formula were, not HF, but H_2F_2 .

Other compounds of fluorine include *hydrofluosilicic acid*, which is prepared by heating a mixture of sulphuric acid, fluorite, and silica (sand or powdered glass), and passing the gaseous silicon fluoride into water. It does not attack glass directly, but on heating it decomposes with formation of free hydrofluoric acid, and this attacks the silica of the glass; hence its application for etching. Hydrofluosilicic acid combines with bases to form salts called *fluosilicates* or *silicofluorides*, of which the most important are those of potassium and sodium. Certain compounds of fluorine have valuable antiseptic properties, and a solution containing 0.61 of ammonium fluosilicate has been used as a wash for wounds. Fluorine compounds may also be employed for preserving food without communicating any taste to it.

FLU'ORITE (from *fluor*), or **FLUOR SPAR**. A calcium fluoride that crystallizes in the isometric system. It is found both massive and crystallized, and may be white, yellow, green, red, blue, or brown in color, sometimes showing a bluish fluorescence. Varieties of fluorite having different colors have been called *false amethyst*, *emerald*, *ruby*, *topaz*, etc. When heated, certain varieties become phosphorescent. Fluorite occurs in Cumberland and Derbyshire, England (where fine-colored specimens called *Derbyshire spar* are found), in Norway, Saxony, and Switzerland. In the United States crystallized varieties have been found in St. Lawrence Co., N. Y.; Hardin Co., Ill.; near St. Louis, Mo., Pike's Peak, Colo., and in the Lake Superior region. Fine transparent specimens have been carved into vases and other similar ornaments, and in such forms fluorite was highly prized by the ancients. Commercial fluorite is obtained in Caldwell, Crittenden, and Livingston counties, Ky.; from near Rosiclare, Ill.; and in Yuma Co., Ariz. It is used as a source of hydrofluoric acid, which is employed for etching on glass, in the manufacture of opalescent glass, and as a flux in iron smelting. In 1912 the production in the United States amounted to 123,387 short tons, having a total value at the mines of \$876,337. A dark-blue Bavarian variety of flu-

orite, called *antizonite*, gives off a strong odor that produces headache and vomiting, said to be due to the liberation of pure fluorine.

FLUOROSCOPE, *flōs-ūr'ō-skōp* (from Eng. *fluorescence* + *σκοπεῖν*, *skopein*, to look). A screen coated with some fluorescent material such as calcium tungstate or barium platino-cyanide, into which the observer looks to see the shadows cast by the Roentgen rays.

FLUOR SPAR. See FLUORITE.

FLÜRSCHHEIM, *flūr'shim*, MICHAEL (1844-1912). A German agitator of land reform, born in Frankfort-on-the-Main. He lived in the United States from 1867 to 1872. Upon his return to Germany he founded the ironworks at Gaggenau, Baden, and in 1892 made his home at Castagnola, near Lugano, Switzerland. He aims to show that the revenues accruing to the individual owner from taxes and ground rent are the primary cause of the accumulation of vast fortunes by the few and of the indigence and suffering of the masses, and that the control of land by the state would remove this evil and would at the same time counteract the evils of socialism. The following maintain the advantages of individualism and are a few of his principal works: *Auf friedlichem Wege* (1884; frequently reprinted); *Deutschland in hundert Jahren* (2d ed., 1890); *Der einzige Rettungsweg* (rev. ed., 1890); *Rent, Interest, and Wages* (1891); *Clue to the Economic Labyrinth* (1902); *The Economic and Social Problem* (1909).

FLUSHING (Dutch *Vlissingen*). A seaport of the Netherlands, situated on the south coast of the island of Walcheren, at the mouth of the western Scheldt (Map: Netherlands, B 3). It was formerly an important fortress and naval station of the Netherlands. Since 1873 it has been transformed into a trading centre, but it is still strongly fortified and commands the entrance to the Scheldt. The port has a large trade in petroleum, wood, and coal, chiefly with England and India. It has an academy of sciences and a school of navigation. The chief industries are shipbuilding and the manufacture of machinery and tobacco and there is a branch of the Krupp gunworks, Essen, Germany, here. The town exports agricultural products. Flushing is the seat of a United States consular agent. A daily service by steamers is carried on with Queenborough, England, which, connecting with the railway at Flushing, is a main artery of eastern Europe. Pop., 1900, 18,893; 1910, 21,807. Flushing is the birthplace of Admiral de Ruyter, and the poet Jacob Bellamy. It was stormed and taken by the English in the Walcheren expedition under Lord Chatham in 1809.

FLUSH'ING. Formerly a village, but in 1908 included in the Borough of Queens, New York City (Map: Greater New York, G 5). It is on the Long Island Railroad, and on Flushing Creek, and has trolley connection with New York. The township was settled in 1643 and the village about two years later, both being called at first Vlissingen, of which the present name is a corruption. About 1660 the population became predominantly Quakers. Flushing is the seat of St. Joseph's Orphanage, the New York Parental School, and a new high school. It has a Carnegie library, nurseries, and manufacturing of chicory, motion picture films, electric signs, chemicals and asphalt. Consult H. D. Waller, *History of the Town of Flushing* (Flushing, 1899).

FLUTE (OF. *flēite*, *flaüte*, It. *flauto*, from OF. *flaüter*, to play the flute, from Lat. *flatus*, blast, from *flare*, to blow; connected with OHG. *blājan*, Ger. *blāhen*, AS. *blāwan*, Eng. *blow*). One of the oldest wind instruments, well known to the ancient Greeks and Hebrews. It has a soft and pleasant quality of tone, is an important instrument in orchestral music, and, in consequence of its easy treatment, is much in favor with amateurs. The flute is commonly made of boxwood or ebony, but sometimes of ivory or silver. Its form is that of a taper tube, made in four pieces, with six holes for the fingers, and with from 1 to 14 keys, which cover or open other holes. The sound is produced by blowing into the embouchure, an oval kind of hole at one side of the thick end, so that the air in its passage from the mouth is broken against the opposite edge of the hole, which causes the column of air inside the tube to vibrate. The notes of the gamut are produced by the opening or shutting of the holes by the fingers of both hands. The compass of the flute is from b to c'.

In the modern orchestra there are always two and often three flutes. When three are required, the third flute is generally the small flute, or *piccolo* (q.v.). Its tones are very shrill and can be employed effectively only in *fortissimo* passages. Before Böhm (q.v.) had perfected the modern flute the *flûte à bec* was used extensively. This instrument had a mouthpiece like the clarinet and was played in a vertical position. (See FLAGEOLET.) If in scores written before the middle of the eighteenth century the name *flauto* occurs, it is always the *flûte à bec* that is meant. Consult: Th. Böhm, *Ueber den Flötenbau und die neuesten Verbesserungen desselben* (Mainz, 1847; in English by W. S. Broadwood, London, 1882); id., *Flute and Flute Playing*, trans. by Miller (Cleveland, 1908); Ch. Welch, *History of the Böhm Flute* (3d ed., London, 1896); P. Alexeieff, *Historisches über Flöte und Flötenspiel* (Riga, 1911); H. M. Fitzgibbon, *Story of the Flute* (New York, 1914).

FLUTE BIRD (so called from its clear note). An Australian shrike (*Gymnorhina tibicen*). See PIPING CROW.

FLUTEMOUTH. See SNIPERFISH.

FLUTE SHRIKE. One of the brightly colored African shrikes of the genus *Laniarius*, so called from the clear whistle uttered by all of the species, one of which is locally called "canariebyter" because it preys upon certain small birds locally known as canaries.

FLUTING. The moldings in the form of hollows or channels cut vertically on the surface of columns. They were adopted by the Greeks as ornaments to their Doric, Ionic, and Corinthian columns, and were retained by the Romans in their architecture. The Tuscan is the only style without flutes. In Doric there are usually 20 shallow flutes on the circumference, and the curves meet with a sharp edge. The channels are so placed that one comes directly under the middle of each face of the capital. These curves, in Greek Doric, are elliptical, and they are carried up across the necking to the base of the cap. In the other styles there are regularly 24 flutes on the circumference, deeper than those on the Doric column. These are semicircular and are separated by a vertical band and, before reaching the necking and the base, are terminated with semicircular top and bottom. Flutes are said to be cabled when they are filled in to

about one-third of their height from the base with a convex bead. This is done to strengthen the column and protect the flutes. In countries where Roman remains were abundant, as in the south of France, fluting was sometimes adopted by the early mediæval architects, as at Arles and Autun. In Italy, also, traces of this decoration are visible during the Middle Ages; but the flutes soon ceased to be vertical and in Romanesque architecture assumed many varieties of forms, such as curves, zigzags, etc., twisting round the shafts. See COLUMN.

FLUX (OF. *flux*, from Lat. *fluxus*, a flow, from *fluere*, to flow). The material added to ores or furnace charges preliminary to melting in order to separate the extraneous matters which by their combination with the flux produce fluid compounds. Fluxes may be either acid, such as silica, or basic, such as limestone. In the smelting of the iron ores the common flux is limestone, which combines with the silica and alumina to form a fluid slag. In the melting and refining of gold and silver bullion borax and various mixtures of borax, soda, and potash, are used to eliminate the oxides of the base metals. Fluor spar is sometimes used as a special flux to hold in suspension nonfusible oxides. Lead oxide is an important basic flux, used in assaying gold-silver ores. The name "white flux" is applied to a mixture of the carbonate and nitrate of sodium or potassium. "Black flux" is prepared by heating in close vessels ordinary cream of tartar (bitartrate of potassium) with half its weight of potassium nitrate, when an intimate mixture of finely divided charcoal and potassium carbonate is obtained. The latter flux, when mixed with finely divided metallic ores, and the whole raised to a high temperature in a furnace, is not only useful in removing the silica, which the potassium carbonate it contains enables it to do, but the charcoal withdraws the oxygen from the metallic oxide and causes the separation of the pure metal. See IRON AND STEEL, METALLURGY OF; COPPER; LEAD; ASSAYING.

FLUX, or PROFLUVIUM. A discharge, generally from a mucous membrane. This old term was applied to all abnormal fluid evacuations from the body, but especially to those from the bowels and from the uterus. Dysentery (q.v.) was long termed "the bloody flux," to distinguish it from simple diarrhœa. See also DIARRHŒA; MENSTRUATION.

FLUXIONS. The name "method of fluxions" was given by Sir Isaac Newton to his calculus

FLUXION.

and was generally employed in England and America until well along in the nineteenth century. The name, the symbolism, and the fundamental idea upon which the method rests,

were then supplanted by those of the Leibnitz calculus. Newton defined a "fluent" as a quantity considered as gradually and indefinitely increasing (flowing, fluxing), and added: "The velocities at which these fluents move I call fluxions"—"*Quas Velocitates appello Fluxiones, aut simpliciter Velocitates vel Celeritates.*" (Colson edition, London, 1736, vol. i, p. 54.) Briefly, his plan was this: Consider a curve described by a moving point $P = (x, y)$, and let the rate at which x increases (flows, fluxes) be designated by \dot{x} , and be called the fluxion of x . In the same

way let \dot{y} be called the fluxion of y . Then $\frac{\dot{y}}{\dot{x}}$ is

the tangent of the angle made by the tangent to the curve at P , with the x -axis. It is therefore

seen that $\frac{\dot{y}}{\dot{x}}$ is merely the $\frac{dy}{dx}$ of the Leibnitz

calculus. The fundamental objection to the principle is that it is based upon the idea of velocity, which involves that of time. To this objection must be added that of the notation employed by Newton. While this has some advantages in certain problems in physics and also in presenting the first ideas of the calculus, it becomes unwieldy when one desires to express successive differentiations. The method of fluxions was used by Newton as early as 1666 and is found in the manuscript of his *De Analysis per Equationes Numero Terminorum Infinitas*, which was circulated among his students in 1669, and in the *Methodus Fluxionum et Serierum Infinitarum*, which he wrote about 1675. The term "fluxion" seems to have been suggested to him by Cavalieri's work. Consult Raphson, *The History of Fluxions* (London, 1715). See CALCULUS; NEWTON.

FLUXION TEXTURE. See IGNEOUS ROCKS.

FLUX OF LIGHT. See PHOTOMETRY.

FLY (AS. *flœge*, Icel. *fluga*, OHG. *flōga*, Ger. *Fliege*, from AS. *flēogan*, to fly, Icel. *fljuga*, OHG. *flōgan*, Ger. *fliegen*; ultimately, perhaps, connected with Lat. *pluma*, feather). An insect of the group which constitutes the order Diptera, a group of very great extent and of great economic importance. Members of the order are characterized mainly by having only two wings, the hind wings being so abbreviated as to be represented only by two small, slender rods known as halteres, or poisers, believed to be of service in assisting the insect to keep its balance and direction in flight. The only other insects which possess but two wings are the males of scale insects of the family Coccidae. The mouth parts of the Diptera are fitted for sucking and piercing, but not for gnawing.

Reproduction. The flies form a very large group, comprising more than 40,000 described species, and in number of individuals it is unexcelled by any other group of insects for the prolificacy and rapid breeding of the many forms. Some curious biological phenomena occur in this group. In a great many flies, e.g., the eggs hatch within the body of the insect, and the living larvæ are deposited. With the group known as the Pupifera, even the larval development is undergone in the body of the female, and the insect is deposited in the pupal condition. The extraordinary phenomenon known as pædogenesis also occurs, and the larvæ of a certain midge are known to give birth to young while yet in the larval condition. The metamorphoses of dipterous insects are more complete than those of any other order of insects. The larva is com-

monly termed a grub, or maggot, and is footless and frequently almost structureless. In

HEAD OF A FLY.

Musca vomitoria: a, eye; b, antennæ; c, maxillary palpi; d, labium or "proboscis."

Many species of the duration of the larval stage is very short. The maggot feeds voraciously, grows with extraordinary rapidity, and transforms to pupa either within the last larval skin or into an appendage-bearing pupa similar to that of certain Hymenoptera or Lepidoptera. The different forms vary greatly in habits. Very many are feeders on decaying animal and vegetable matter. Others are parasites on warm-blooded animals. Many forms are aquatic. Others feed upon living vegetation, while others form galls upon different plants. Among the plant-feeding flies some species have high rank as injurious insects, as the Hessian fly and the onion maggot, the apple maggot, and others, while whole regions are rendered almost uninhabitable by the presence of forms which annoy men and animals.

Habits and Economy. Adult flies vary greatly in structure and in habits. With some the mouth parts are fitted for piercing the skin of warm-blooded animals—the mosquitoes and the gadflies, e.g., are especial torments of men and animals. The discovery that certain dipterous insects are important factors in the transfer of disease has rendered them the subject of special study of late years. The function of certain mosquitoes in the transfer of yellow fever and malaria, the transfer of anthrax by certain gadflies, the carriage of the germs of an African fever by the tsetse fly, the conveying of the germs of the purulent ophthalmia of the Egyptians and Fiji Islanders by the house fly, the transfer of the germs of typhoid fever and cholera by flies, and the spread of the disease known as pinkeye in the Southern States by midges, are all instances of this maleficent function. Detailed information may be found in Howard, *Carriage of Disease by Flies* (Agricultural Department, Washington, 1901); Doane, *Insects and Disease* (New York, 1910). See INSECTS, PROPAGATION OF DISEASES BY.

On the other hand, the Diptera do perform, in many cases, beneficent services to their fellow creatures. Many forms frequent flowers and are important agencies in the cross-fertilization of plants. See FLOWERS AND INSECTS.

Edible Flies. That flies should furnish human food is one of the most curious features of their history. Small species of the genus *Ephydra*, allied to the horseflies, inhabit some alkaline lakes of the western United States and Mexico in enormous swarms. Such is the case in Lake Mono, Cal., whose water is so dense with salts that no fish or amphibian can live in it. The *Ephydra* flies resort there in countless swarms, dropping their eggs, and the larvæ develop so numerously that they drift in heaps along the shore and at the proper season used to be gathered for food by the Indians, who would come long distances for the purpose. The grubs were dried in the sun on blankets and then rubbed in the hands to remove the shell,

when there remained a yellowish kernel like a grain of rice, which was ground fine and baked into cakes. This food, called *koo-chah-bee*, is oily, nutritious, and not unpleasant in taste. The species is *Ephydra californica*. A similar preparation, under the name of *ahuatle*, is made from the eggs of *Ephydra hians* in Mexico. These eggs are laid on sedges, which the natives about Lake Texcoco purposely set afloat. The sedges are then collected and beaten over a cloth, knocking the eggs off, which are then cleaned and ground into flour. The larvæ of these flies are also eaten under the name of *puat*.

Classification. The difficulties in the systematic study of the Diptera are very great, and in many groups the species or number of families have not been well worked up, on account of the difficulty of preserving specimens, since they are so slender and fragile. It is probable that not more than a quarter of the species in existence have been named and classified, and Dr. Howard estimates that the order includes no less than 350,000 species. The latest comprehensive study in this direction has been made by M. D. Coquillett, of the United States De-

HOUSE FLY.

The adult house fly (*Musca domestica*) and its full-grown larva.

partment of Agriculture, who divides the order into two suborders:

I. *Eproboscidea*, embracing only the parasitic pupiparous families Hippoboscidae (see FOREST FLY) and Nycteribiidae (bat ticks), whose proboscis is never furnished with terminal lips; and

II. *Proboscidea*, embracing all other flies never parasitic on mammals, birds, or honeybees, and having the proboscis terminating in lips and oviparous or larviparous.

In the suborder Proboscidea he finds two sections—(1) Orthorhapha and (2) Cyclorhapha. In the first are placed such slender, elongated, often long-legged groups as the crane flies, midges, mosquitoes, moth flies, snipe flies, and gnats, together with the more robust families of March flies, gadflies, bee flies, robber flies, and their immediate allies. In the second section will fall the syrphus flies, the botflies, Tachina flies, flesh flies, house flies (q.v.), dung flies, fruit and gall flies, and several groups of small forms closely related thereto.

Fossil Flies. Fossil flies or Diptera are less common than are representatives of the Coleoptera and Orthoptera, but more frequent than other insects. They appear first in the Liassic rocks and continue through the Jurassic and Cretaceous; but the remains in these formations are usually poorly preserved. The Tertiary Diptera represent nearly all the modern families; those of the Tipulidae (crane flies), Bibionidae (March flies), and Syrphidae are most com-

mon. The amber of the Baltic region and the shales of Oeningen, Germany, are especially rich in dipteran fossils, and those found in the amber are usually beautifully preserved. In North America the shale beds at Florissant, Colo., are the most prolific sources and have yielded more than 1500 specimens of *Bibionidæ* alone. None of the fossil *Diptera* present any striking departures from the modern types. Consult Scudder, "Systematic Review of our Present Knowledge of Fossil Insects," in *Bulletin 31, Geological Survey* (Washington, 1886). See *INSECT*.

FLY. A river of New Guinea, rising at the base of the Victor Emmanuel Mountains, in the British portion of the island, and flowing first southwest and then southeast, emptying into the Gulf of Papua (Map: Australasia, G 3). For a portion of its course it marks the boundary between British and Dutch New Guinea. Its two main tributaries are the Alice and Strickland rivers. The banks are covered with mangrove trees, and at its mouth there is a wide delta. Its course is about 620 miles from the sea to the British-German boundary, and it is navigable by steam launch for over 500 miles.

FLY AG'ARIC. See *AMANITA*; *FUNGI*, *EDIBLE AND POISONOUS*.

FLY AMANITA. See *AMANITA*.

FLY CASTING. Of the three main methods of angling, casting the fly is the most scientific and universal. In the United States its devotees are divided into two schools—the old-time, or "wet-fly," anglers, who whip the stream with a cast of flies and shift from place to place; and a new school of "dry-fly" anglers, so called because they use but one very small fly on their line, and that constructed with upright wings, so that when it drops on the water it remains dry and natural, and is permitted to float with the current, instead of being trailed against it, as the wet fly is. Both schools use in common a light, elastic, three-jointed rod, from 9 to 10 feet long, varying in weight according to the skill of the angler or the use to which it is to be put, from 3½ ounces upward. The line for trout is of waterproof silk, braided, of size F or G (the heavier being more easily cast); at the end of the line is attached a *leader*, made of single strands of clean, round, silkworm gut; to this is tied the fly, or two or three, according to the method of the angler. Leaders may be stained a neutral tint by soaking in a strong solution of green tea and kept between layers of damp felt. Before use they should be softened in water, or the gut may crack and become worthless. Beneath the rod, at the extreme end of the butt, should be fixed

a click reel, preferably of the multiplying type. Casting the fly involves many intricate movements, to be perfected only by long practice. An expert in this beautiful art will handle accurately from 100 to 115 feet of line with a five-ounce rod, or 150-odd feet with a large salmon rod. Consult Gill, *Practical Dry-Fly Fishing* (New York, 1912) and *Dry-Fly Man's Handbook* (ib., 1913). See *FISHING*; *SALMON FISHING*; *TROUT FISHING*.

FLYCATCHER. 1. A name given to various birds of the order *Passeres*, but originally applied to those of the thrushlike family *Muscicapidæ*, having a moderately long, angular bill, broad and depressed at the base, compressed and slightly curved at the point; the base surrounded with stiff hairs or bristles directed forward, which help to secure insect prey. The legs and feet are small; the outer toe the longest and attached to the middle one as far as the first joint. The wings are not long; their first quill feather is very short; the third is the longest. The birds of this family, as now restricted, are exclusively confined to the Old World and mostly to the warmer parts of it. The true flycatchers all have the habit of remaining perched for a long time in the same spot, only leaving it to make a sudden dart at a passing insect, which is seized with a snap of the bill, and then returning. They are almost never to be seen running on the ground, or even on the branches of trees, and do not chase insects in the air like swallows. Even in the restricted use of the name the *Muscicapidæ* include about 700 species, arranged in nearly 100 genera. Only four species are European, two of which are British—the spotted flycatcher (*Muscicapa striata*, or *grisola*) and the pied flycatcher (*Muscicapa hypoleuca*, or *atricapilla*)—birds about the size of a sparrow, the former of which is common in most parts of England as a summer bird of passage, but rare in Scotland; the latter is rare in Great Britain, although abundant in the south of Europe. The spotted flycatcher is brownish gray above, white beneath, the head and breast marked with dusky spots. Its call is a mere chirp. It is remarkable for the choice it makes of situations for its nest, often on a beam in an outhouse, on the side of a fagot stack, on the branch of a tree trained against a building, and sometimes even on a lamp-post in a street. It has been observed that a single pair of spotted flycatchers feed their young no fewer than 537 times in one day, and that their motions are so rapid that, to count the number of visits accurately, the observer must not take his eye off the nest for a moment.

2. The name "flycatcher" is often extended to birds of similar habits belonging to other families. In America the name is universally applied to the birds of the family *Tyrannidæ*, often styled "tyrant flycatchers." This family is peculiar to America and contains some 500 or 600 species, of which less than 40 occur in the United States. They are more or less solitary and sedentary in their habits and feed like the true flycatchers. The shape of the wings and tail enables these birds to twist and turn in the air with remarkable agility and grace. The flycatchers, being entirely insectivorous, are necessarily migratory in most parts of the United States. They have no power of song, but their notes are characteristic and in some species not unmusical. The colors are generally dull, though some of the tropical forms

offer striking exceptions. Among the numerous remarkable birds of this family can be mentioned only a few genera: *Tyrannulus*, notable for the diminutive size, the type species being less than 3 inches long; it is found in northern South America. *Todirostrum*, small, very brightly colored South American species, with a bill like that of a tody (q.v.). *Fluvicola*, small black and white birds of the South American pampas, called water caps, because of their fondness for water. *Pitangus*, the large derby flycatchers of Mexico, nearly a foot long. *Milvulus*, the graceful and striking swallow-tailed flycatchers, in which the tail is very long and deeply forked, as in the barn swallow; they are found in tropical America, but one species is common in the southern United States, especially Texas. Among the common flycatchers of the eastern United States may be mentioned the kingbird (q.v.); the least flycatcher (*Empidonax minimus*), called "chebec," from its characteristic note; the small green Acadian and Traill's flycatcher, or "pewees"; the olive-sided flycatcher (*Nuttallornis*, or *Contopus borealis*), a very solitary but noisy woodland species, nowhere very common; and the great-crested flycatcher (*Myiarchus crinitus*), a handsome woodland species with a loud and very characteristic note. See KINGBIRD; PEWEE; PHOEBE; SCISSOR-TAILED FLYCATCHER; Plate of FLYCATCHERS; Plate of EGGS OF SONG BIRDS.

FLYING BOAT. See AERONAUTICS.

FLYING BRIDGE. See FERRY.

FLYING COLUMN. Usually a small army of cavalry and infantry and, where possible, horse artillery, complete in itself and carrying its own principal supplies. It is organized for rapidity of movement, freedom from all unnecessary impedimenta, and is comparatively independent of its original base of operations. It is generally used for imperative purposes, as the securing of strategical points, the relief of garrisons in extremities, or to circumvent some countermove of the enemy. The most important instance of modern times was the flying column of British troops, organized after Maiwand, under General (now Field Marshal, Earl) Roberts, who marched 300 miles in 20 days, fighting a decisive battle at the end of the march. The march was commenced on Aug. 9, 1880, at Kabul, and carried out through a mountainous and hostile country.

FLYING DRAGON, or FLYING LIZARD. See DRAGON.

FLYING DUTCHMAN. According to the legend, the shade of the Dutch sea captain Van Straaten, condemned for his sins to sail the high seas in a spectral ship, the sight of which is a bad omen to sailors, who quickly change their course to avoid its fatal influence. The legend has its prototype in many tales of the German mythology, and similar stories are current in other countries. In England Vanderdecken is the name of the captain, and the phantom ship is the exact image of a real vessel. It is related that originally he was delayed by head winds while trying to turn the Cape of Good Hope and blasphemously swore that he would beat around the cape if it took till Judgment Day. When seen in those waters, his vessel may be recognized by the fact that it comes up against a head wind with all sails set. This legend forms the subject of Wagner's opera *Der fliegende Holländer* (q.v.).

FLYING FISH. A name given to all those

fishes which have the pectoral fins so very large that by means of them they are sustained in short seeming flights in the air. These fishes belong to two very different families—Exocoetidae and Cephalacanthidae; but the name "flying fish" is sometimes limited to those of the former family, those of the latter being known as *flying gurnards*. (See FLYING GURNARD.) The true flying fish of the genus *Exocoetus*, in which the pectoral fins are nearly as long as the body, are numerous in species and occur in most parts of the oceanic world. The one best known is that of the North Atlantic (*Exocoetus volitans*), which occurs abundantly in the open seas, is found on the coast of South Europe, and is not uncommon on the Atlantic coast of North America; it is also found near the Hawaiian Islands. It is dark brown, with an oblique whitish band from the axil back to the middle of the fin. (See Plate of NEEDLE FISH.) Another common species of the Atlantic is *Exocoetus furcatus*, having about the same range as the above. The great flying fish (*Exocoetus californicus*), common on the California coast, attains a length of 18 inches. The other species range from 6 to 12 inches in length. A somewhat different one is the sharp-nosed flying fish (*Fodiator acutus*), common on both sides of Central America. All these are good food fishes, and the favorite food of many predatory fishes, such as bluefish, albacore, porpoises, etc., to escape which their flights are undertaken. Birds often seize them in the air, and they frequently leap on board boats and small ships.

Close observations of their method of flight have been made by Jordan and his assistants, Gilbert and Evermann, a summary of which is given in *Fishes of North America* (Washington, 1883), as follows: The flying fishes live in the open sea, swimming in large schools. They will "fly" a distance of from a few rods to more than an eighth of a mile, rarely rising more than three or four feet. Their movements in the water are extremely rapid; the sole source of motive power is the action of the strong tail while in the water. No force is acquired while the fish is in the air. On rising from the water the movements of the tail are continued until the whole body is out of the water. While the tail is in motion, the pectorals seem to be in a state of rapid vibration, but this is apparent only, due to the resistance of the air to the motions of the animal. While the tail is in the water, the ventrals are folded. When the action of the tail ceases, the pectorals and ventrals are spread and held at rest. They are not used as wings, but act rather as parachutes to hold the body in the air. When the fish begins to fall, the tail touches the water, when its motion again begins, and with it the apparent motion of the pectorals. It is thus enabled to resume its flight, which it finishes finally with a splash. While in the air it resembles a large dragon fly. The motion is very swift, at first in a straight line, but later deflected into a curve. The motion at first has no relation to the direction of the wind, but when in full flight the fish veers around and scales along with the wind. When a vessel is passing through a school of these fishes, they spring up before it, moving in all directions, like grasshoppers in a meadow.

For comparative descriptions of the species of flying fishes, consult Jordan and Meek, *Proceedings United States National Museum* (Washington, 1885). A very complete series of the Ameri-

TYPICAL FLYCATCHERS

1. WOOD PEWEE (*Contopus virens*).
 2. SCISSOR-TAILED FLYCATCHER (*Milvulus forficatus*).
 3. CROWNED TYRANT FLYCATCHER (*Muscivora Mexicana*).

4. BEAK OF A TYRANT FLYCATCHER (a pewee) from above, showing its breadth and bristles.
 5. SPOTTED FLYCATCHER (*Muscicapa grisola*).
 6. GREAT-CRESTED FLYCATCHER (*Myiarchus cinerascens*).

can forms is in the Museum of the Academy of Natural Sciences at Philadelphia. Consult Gill, *Flying Fishes and their Habits* (Washington, 1904). See Plate of NEEDLE FISH.

FLYING, FLIGHT, MECHANICAL. See AERONAUTICS.

FLYING FOX. 1. A fox bat, or fruit-eating bat of the East. (See FOX BAT.) 2. A flying lemur. See COBEGO.

FLYING FROG. A small frog, whose long toes are connected by membranes, and which makes sailing leaps from tree to tree. It belongs to the family (Ranidæ) of ordinary water frogs, but is wholly arboreal in habit and forms the genus *Rhacophorus*, characterized not only by the webbing, but by the presence of a small additional bone between the last two joints of the toes, which terminate in disks. All are normally richly green (with yellow bellies), rendering them invisible amid the foliage; and, in addition, they possess in a high degree the power of changing their color (see METACHROSIS) to conform to the color of the surface they rest upon. Over 40 species are known, most of which inhabit the Malay Archipelago, Ceylon, and the adjacent shores of Asia, while 12 species are natives of Madagascar. One of the best known is the Bornean species (*Rhacophorus pardalis*), discovered by Wallace. In this the webbing between the toes is extensive, all four together covering a space of about 12 square inches, and the forelegs are bordered by a membrane. In most of the other species the webbing is less extensive, and the distance they can glide through the air is correspondingly decreased. They breed in the water, like other tree frogs, are mainly nocturnal in their movements, and the males are noisy. "The larvæ are remarkable for the possession of an adhesive disk behind the mouth on the undersurface, while the muzzle is prolonged into a proboscis, and the single breathing pore is situated on the right side of the body, nearer to the tail than to the muzzle." Consult: Wallace, *Malay Archipelago* (New York, 1898); Tennent, *Ceylon* (London, 1859).

FLYING GECK'O. A small lizard, having a parachute, enabling it to sail through the air. See GECKO, and compare with DRAGON.

FLYING GURNARD, or FLYING ROBIN. A fish of the family Cephalacanthidæ allied to the gurnards or sea robins (q.v.), but remarkably distinguished by the great size of the pectoral fins, used for the same purpose and in the same way as those of the true flying fish. The pectoral fins are, however, of a very different appearance from those of the Exocetidæ, widening almost to the end, which is rounded, and the tips of the rays extend considerably beyond the membrane. A very long spine points backward from the gill cover on each side. The species are few in number, and all are pelagic. One (*Cephalacanthus volitans*) inhabits the middle latitudes of the North Atlantic, is usually about 12 inches in length, and has similar habits to those of the flying fish, but does not fly so well; it is often called batfish.

FLYING JIB. See JIB.

FLYING LEMUR, or COLUGO. See COBEGO.

FLYING MACHINES. See AERONAUTICS.

FLYING PHALANGER, or MOUSE, or OPOSSUM. The name given to various marsupial quadrupeds of the subfamily Petaurinae, natives of New Guinea and of Australia, where they are generally called squirrels or flying

squirrels. They are nearly allied to the phalangers (q.v.), but have not so long and prehensile a tail, while they are distinguished by a hairy fold of the skin along the flanks, used as a parachute. There are several different genera, of which *Petaurista* includes the large forms, some of which are 20 inches long besides the tail, and

DENTITION OF FLYING PHALANGER.

Acrobates includes the smallest forms, only 3 or 4 inches long. The flying membrane extends along both fore and hind legs almost to the toes, but does not appear behind the hind legs, nor include the tail, which is pretty long and bushy, but which in some of them has a distichous character, the hair spreading out to the sides, and so rendering it useful in supporting as well as in guiding the body in the air. They are capable of modifying their course in the air, although this is not in the nature of true flight; and their aerial evolutions are very graceful. They sleep during the day and become active in the evening. They feed on fruits, leaves, insects, etc. A New Guinea species is about as large as a flying lemur; one of the Australian species (*Acrobates pygmaeus*) is scarcely larger than a mouse and feeds on the nectar of flowers and some insects. The fur of some of them is rich and beautiful. "Petaurist" has been proposed as an English name for these animals, but is not much used. See MARSUPIALIA, and the authorities there cited.

FLYING ROBIN. See FLYING GURNARD.

FLYING SQUID. A squid of the genus *Ommastrephes*, having a tail so large as to be able to leap out of the water, high enough sometimes to fall upon the decks of ships. They form a principal part of the food of many of the whales and are often the prey of albatrosses, petrels, and other marine birds. Some species reach a length of several feet. See SQUID.

FLYING SQUIRREL, skwēr'el or skwīr'el. A squirrel which has a fold of the skin of the flanks (a "parachute") extended between the fore and hind legs and partly supported by bony processes of the feet, by means of which it is enabled to take extraordinary leaps, gliding for a great distance through the air. The distichous tail also aids to support it in the air as well as to direct its motion. The single family, Petauristidæ, containing rodents with these characters, is divided into eight genera, one of which *Sciuropterus*, is represented in Europe, Asia, and North America. The other genera contain large species characteristic of the Indian and East Indian region. The European species (*Sciuropterus rusticus*) is about the size of a rat, grayish ash color above, white below, the tail only half the length of the body; it lives solitary in the forests. Its fur is of little value, but skins are sometimes mixed with those of the gray squirrel, to impose on the purchaser. The most common North American species (*Sciuropterus volans*), common in the central eastern United States, is fully 5 inches long, plus a tail

equally long. It is brownish gray above, white beneath, and a black line surrounds the orbit of each eye. Four species and some 17 races are recognized in North America, ranging from Florida to Alaska.

All the flying squirrels inhabit woods, and the night is their time for activity. They feed not only on nuts and young shoots of trees, but also are said to kill and eat small birds and to rob birds' nests. They are easy of domestication, but are apt to bite and do mischief to furniture and hangings, especially by gnawing woolen stuffs to pieces as material for their nests. These are naturally placed in some cranny of a hollow tree, preferably a deserted woodpecker's hole, but may be placed within a house. In gliding from tree to tree the flying squirrel descends obliquely and with very rapid motion, until near the tree which it seeks to reach, when it wheels upward and alights on the trunk. Fifty or 60 feet is the ordinary length of its flight. See *SQUIRREL*, and the authorities mentioned thereunder; and *Plate of SQUIRRELS*. Consult Seton, *Life-Histories of Northern Animals* (New York, 1909).

The name is also applied in Australia to flying phalangers (q.v.), and in Africa to the scale-tailed squirrels of the family *Anomaluridae*. These little creatures, which belong in West and Central Africa, much resemble American flying squirrels in appearance and habits, but the tail is more slender, and has on its inferior surface and margins, near the root, a series of large imbricated scales, that are of service in climbing; the parachute is distended and supported by a stiff cartilaginous process from the olecranon. Consult *Proceedings Zoölogical Society of London* (London, 1874-75).

FLY MUSHROOM, or FLY AMANITA. See *AMANITA*; *FUNGI*, *EDIBLE AND POISONOUS*.

FLYNT, JOSIAH (properly Josiah Flynt Willard) (1869-1907). An American sociologist and author, born at Appleton, Wis. He was educated at the University of Berlin in 1890-95 and after several years of experience as a professional vagrant published in 1899 *Tramping with Tramps*, a novel and picturesque study. His further works dealing with the lower and criminal classes include *The Powers that Prey* (1900), a collection of short stories written in collaboration with Francis Walton; *Notes of an Itinerant Policeman* (1900); *The World of Graft* (1901), also a volume of short stories; and *The Little Brother* (1902), his only sustained attempt in fiction.

FLY SNAPPER. One of the names of a rare and very beautiful crested flycatcher (*Phainopepla nitens*) of the southwestern United States. It is entirely rich lustrous black with steel-blue or greenish reflections, and with a large white space on the inner webs of the wing quills. Its length is about 7½ inches. The female is brownish gray, but crested. It frequents bushes in the desert regions of Nevada, Arizona, and southern California. It also feeds extensively on various berries and has, in short, much the habits and manners of a waxwing. Its customary note is described as a "rattling call"; and it makes a rude nest in a bush or tree, and lays two eggs, greenish white, so thickly marked with dark brown and purple that some specimens seem almost totally black. Consult: Coues, *Birds of the Colorado Valley* (Washington, 1878); Bailey, *Handbook of Birds of the Western United States* (Boston, 1902); Nuttall,

Popular Handbook of the Birds of the United States and Canada (ib., 1903).

FLY-UP-THE-CREEK. A local name in the United States for the little green heron, or shitepoke (*Ardea virescens*), common throughout the United States and southern Canada. See *HERON*.

FLY WEEVIL. A local name in the United States for the grain moth (*Gelechia cerealella*). See *GRAIN INSECTS*.

FLYWHEEL. A heavy wheel attached to the revolving shaft of a steam engine to serve as an accumulator and equalizer of power. Its action depends upon the mechanical law that a body once set in motion retains a certain amount of moving force or momentum which has to be overcome before motion ceases. Thus, a heavy wheel once set to rotating by some external force, as the pressure on the piston of a steam engine or internal-combustion motor, continues to rotate by virtue of its stored energy or momentum after this external force ceases to act. In a steam engine the function of a flywheel is: (1) to store up excess of energy received from the piston during the first part of its stroke under full steam pressure, and to give it out when, during the latter part of the stroke, the effort has grown less because of decreased pressure due to the expansion of the steam; (2) to equalize the variation in the leverage with which the varying steam effort acts upon the crank to revolve the shaft; (3) to give out or absorb energy when variation in the external load or resistance occurs suddenly. In the internal-combustion engine, which is usually single-acting, and operates in a cycle of events in which the power stroke occurs only once in four traverses of the piston, the flywheel becomes of special importance to secure regulation of the speed. (See *INTERNAL-COMBUSTION ENGINES*.) In the earlier single-cylinder engines the flywheel was of enormous weight, particularly when the engine drove an electric generator. Fluctuations of speed and of turning effort are here very undesirable, and the revolving mass of the generator is often counted on for flywheel action. In the smaller sizes of such engines, such as are used in boats and motor vehicles, the use of multiple cylinders has become very general, so as to lessen the irregularity of effort and to lighten the flywheel. Motor-vehicle flywheels are often combined with the engaging and disengaging mechanism called the clutch; and the high rotative speed is depended on to make a light weight effective in regulation. In marine engines the revolving screw or the paddle wheel functions as the flywheel in whole or in part. In the locomotive the driving wheels coupled together and with cranks at right angles are the engine flywheel; and the moving train is a very complete reservoir or accumulator of stored energy.

The flywheel is therefore, as described, an accumulator and an equalizer, and the reserve which it stores will be greater as its mass is greater, and the leverage greater with which that mass acts. Large mass means great weight and consequently great friction on the shaft bearings. Large leverage or large radius means more space required for the wheel and increased centrifugal force tending to disrupt its rim. The designer of a flywheel has to integrate these different factors to meet the requirements of space, speed of rotation, and other governing conditions. Modern practice shows a tendency

to adopt smaller diameter wheels than were once customary; in early engines 30-foot flywheels were often to be met, but now 18 to 20 feet are large diameters in stationary engines, and in centre-crank high-speed engines 6 feet has become a large size. The strains which are set up in a flywheel because of the work which it has to do are, first, a torsional strain tending to twist the spokes off the hub, and, second, a strain due to centrifugal force which tends to burst the rim. A flywheel can easily be designed to resist torsional strains, but there is no possible way to overcome the centrifugal force; hence for a given material there is a definite speed at which disruption will occur regardless of the amount of material used. A recent authority gives the following simple formula for figuring the disrupting speed of flywheels having solid, single-piece rims:

$$v = 1.6\sqrt{\frac{s}{w}}$$

In this formula v represents rim speed in feet per second at which disruption occurs, s represents the ultimate tensile strength of the material per square inch, and w represents the weight of the material per cubic inch. If, instead of ultimate strength, we let s represent the safe strength, then by solving the equation for v we get the safe rim speed in feet per second. If the wheel is made of sections bolted together, the ultimate and safe values of s in the above formula must be reduced to from one-half to one-fourth of the figure assumed for solid wheels. The safe rim speed of a solid cast-iron wheel figured according to this formula is about 100 feet per second, of a cast-steel wheel about 233 feet per second, and of a maple-wood wheel about 155 feet per second.

The disruption or bursting of a flywheel revolving at high speed occurs with great force, the flying fragments often wrecking the engine and building in which it is housed and sometimes being thrown several hundred feet away. Flywheel accidents are less common than formerly, but are still frequent enough to make the designing of strong and safe wheels a problem for serious study by engineers.

In early engines turning with a low number of revolutions the flywheel required to be of large diameter, and was for this reason nearly always distinct from the wheel from which the power was taken off. In more modern engines the convenience of having the flywheel serve also as an element of the transmission machinery has brought about the use of fly-band wheels, where belts or ropes are used to take off the power from the engine shaft. It is so much less the practice in recent years to use gearing in transmitting the power from the engine shaft that the flywheel is seldom a toothed wheel. Small flywheels are usually made in one piece of cast iron or cast steel. Larger sizes are cast in halves, which are connected by bolted joints to form the complete wheel, and the largest wheels are cast in several segments which are bolted together. Flywheels are sometimes made with metal hub and arms and a rim of some tough, hard wood. Other constructions are steel plates riveted together, and cast wheels with their rims wound with steel wire of great strength. (See STEAM ENGINE.) Very complete data for use in the calculation and design of flywheels will be found in Kent's *Mechanical Engineer's Pocket-Book* (8th ed., New York, 1913).

FO. The Chinese equivalent for Sanskrit Buddha. See BUDDHISM.

FOA, fô-a', EUGÉNIE (1798-1853). A French romance writer, born at Bordeaux. She was by descent a Spanish Jewess, and her maiden name was Gradis. She married young, but soon left her husband, and, despite delicate health and failing eyesight, she supported herself by her pen, using at times the nom de plume "Maria Fitzclarence." Madame Foa's books include: *Le vidouschim* (1830); *La Juive: histoire des temps de la régence* (2 vols., 1835); *Les mémoires d'un polichinelle* (1839); *Le petit Robinson de Paris* (1840); *Le vieux Paris* (1840). She wrote charming tales for young people, with the moral not unduly prominent.

FOAKES-JACKSON, FREDERICK JOHN (1855-). An English theologian, born in Ipswich and educated at Eton and at Trinity College, Cambridge (B.A., 1879; M.A., 1882). He was ordained in 1880 and became divinity lecturer (1882), fellow (1886), and dean of Jesus College, Cambridge. He edited *Parting of the Ways* (1912), essays by members of Jesus College, and in 1902 was Hulsean lecturer. He wrote: *History of the Christian Church to A.D. 337* (1891; 5th ed., with additions to 461 A.D., 1909); *Christian Difficulties: A Study of Marcion* (1903); *A Biblical History of the Hebrews* (1903; 3d ed., 1910); *Biblical History for Schools* (vol. i, Old Testament, 1912; vol. ii, New Testament, with B. T. D. Smith, 1913).

FOCA, fôt'châ, or **FOTCHA**. A Bosnian town of about 5000 inhabitants, situated at the confluence of the Drina and Tchahotina rivers, near the Montenegrin frontier (Map: Austria-Hungary, F 5). The Mohammedans regard it with particular reverence on account of its mosques, which are reputed to be the most splendid and the oldest in Bosnia. It was the seat of turbulent wars during the Middle Ages well after the Turkish occupation of the region. In the sixteenth century it acquired commercial importance on account of its position on the inland highway connecting Ragusa and Constantinople. The town is noted for the beauty of the forest-clad mountain slopes which surround it completely.

FOCAL LINES. See FOCI; LIGHT.

FOCI (Neo-Lat. nom. pl., points, from Lat. *focus*, hearth, ML., central point). Points the distances of which from any point on a given curve are connected by a definite relation. In the case of conics the foci are points on the principal axis, such that the corresponding double ordinate is equal to the parameter of the curve. The term "focus," used in this sense, is due to Kepler (1604). By varying the values of the constants in the equation $y^2 - m^2x = 2px$, it may be made the equation of an ellipse, parabola, or hyperbola, according as m^2 is < 0 , $= 0$, or > 0 . The abscissas of the foci will be found by substituting $y = p$ in the equation of the curve, whence

$$x = \frac{-p(1 \pm \sqrt{m^2 + 1})}{m^2}$$

From these values of the abscissas, considering m^2 as positive, zero, and negative successively, we see that the ellipse and hyperbola have two finite foci, while the parabola has one finite focus and one at infinity. The name "focus" was originally given to these points from the fact that rays of light emanating from either focus are reflected by the curve through the other. The

distance from the foci of curves to every point of the curve can be expressed rationally in terms of the abscissas of the points—a unique property. Curves of higher degree may have several foci. (See CARTESIANS.) The foci of a conic possess the property that the straight lines which connect them to the circular points at infinity are tangents to the curve. In general a point P is said to be a focus of a curve when the lines connecting this point with the circular points at infinity are tangents to the curve. A curve of the n th class has n^2 foci, but, the curve being real, n and only n of these foci are real. See CURVE; ELLIPSE; PARABOLA.

In optics the term "focus" is employed to designate a point at which rays meet and are collected after being reflected or refracted. A point from which rays appear to come after reflection or refraction is termed a "virtual focus." The "principal focus" is the focus of parallel rays after reflection or refraction. See LENS; MIRROR; LIGHT.

FOCUS. See FOCI.

FODDER. See FEEDING STUFFS.

FODDER, GREEN. See SOILING; SILAGE.

FODERÉ. See PRADIER-FODERÉ.

FŒDERA, fœd'ër-ä (Lat., treaties). A collection of documents bearing on state transactions between the kings of England and others from 1101. Fifteen volumes were compiled by Thomas Rymer (q.v.) from 1693 to 1713, and after his death five volumes were used by Robert Sanderson (1715-35), covering the documents down to 1654. The work as abridged in a French version by Rapin was retranslated into English by Stephen Whatley, under the title *Acta Regia* (1781).

FŒTUS, fœ'tüs (Lat., offspring). The term applied to the unborn young of viviparous animals, especially in the more advanced stages. In the human subject the term "fœtus" is applied to the embryo, though more often to the unborn child after the end of the fourth month, when human features are distinguishable. The *fourth-month* fœtus weighs about five ounces and is about 6 inches long; its brain convolutions are found to be developing, and its sex is recognizable; its muscles are capable of producing movements of the limbs, and ossification can be traced in the bones of the skull. The *fifth-month* fœtus weighs about 10 ounces and is about 10 inches long; hair and nails appear, and ossification in the ischium takes place in course of the fifth month. The *sixth-month* fœtus weighs about one pound and is 11 or 12 inches long; its eyelids, with eyelashes formed, are closed; fat gradually develops under its skin, and its pubic bones undergo ossification. The *seventh-month* fœtus weighs from three to four pounds and is from 13 to 15 inches long; its skin is covered with sebaceous matter, and the fat under its skin attains to a considerable amount; its eyelids are open. The *eighth-month* fœtus weighs from four to five pounds and is from 16 to 18 inches long; its nails are completely developed, and the *membrana pupillaris* has disappeared. The *ninth-month*, or full-term, fœtus weighs from five to nine pounds, or six and one-half pounds on an average, and is from 17 to 21 inches long. The average weight and length of the male infant slightly exceed those of the female, even at birth; the average excess in weight is about 12 ounces, the average excess in length about 4.8 inches. Clark observes that if, at the full term, the weight of

the infant is less than five pounds it rarely thrives, though a few cases are recorded of surviving children who weighed one pound at birth. On the other hand, various instances are recorded of infants in which the weight at birth exceeded twice the average weight. There are certain points in which the fœtus at the full period differs anatomically from the child shortly after birth. The bony skeleton is very incomplete, cartilage occurring in the place of many bones. Indeed, complete ossification (e.g., of the vertebrae) is not finished until about the twenty-fifth year, and the only bones completely ossified at birth are the minute ossicles of the ear. The difference between the fœtus and the child in this respect is, however, only one of degree.

During pregnancy a temporary organ, termed the placenta (popularly known as the afterbirth, from its being delivered shortly after the child), is developed on the inner wall of the uterus. This organ is mainly composed of vessels, and there proceeds from it the structure known as the umbilical cord, in which lie the umbilical vein, which conveys arterial blood to the fœtus, and the two umbilical arteries, which return the blood to the placenta. This umbilical cord conveys these vessels to the umbilicus, or navel. In the heart we find a communication between the two auricles by means of an opening termed the *foramen ovale*. In the arterial system we have to notice, first, the *ductus arteriosus*, which is a large communicating trunk between the pulmonary artery and the descending aorta; and, secondly, the branches given off by the internal iliac arteries, which go under the name of hypogastric as long as they are within the body of the fœtus, and of umbilical when they enter into the structure of the cord, and are continued from the fœtus to the placenta, to which they return the blood which has circulated in the fœtal system. In the venous system there is a communication between the umbilical vein and the inferior vena cava, called the *ductus venosus*.

Pure blood is brought from the placenta by the umbilical vein, which passes through the umbilicus and enters the liver, where it divides into several branches, which are distributed to that viscus, the main trunk, or *ductus venosus*, passing directly backward, and entering the inferior vena cava. The pure blood here becomes mixed with the impure blood which is returned from the lower extremities and abdominal viscera, and is carried into the right auricle, and from thence, guided by the Eustachian valve (which is situated between the anterior margin of the inferior cava and the auriculo-ventricular orifice, and is of relatively large size in the fœtus), passes through the *foramen ovale* into the left auricle. From the left auricle it passes into the left ventricle and into the aorta, whence it is distributed by the carotid and subclavian arteries principally to the head and upper extremities, which thus receive comparatively pure blood. From the head and arms the impure blood is returned by the superior vena cava to the right auricle; from the right auricle it is propelled, as in the adult, into the right ventricle, and from the right ventricle into the pulmonary artery. In the adult it would now pass through the lungs and be oxygenized; but in the fœtus it passes through the *ductus arteriosus* into the commencement of the descending aorta, where it mixes with that portion of the pure blood which is not sent through the carotid and subclavian arteries. Some of this mixed

blood is distributed by the external iliac arteries to the lower extremities, while the remainder (probably the larger portion) is conveyed by the hypogastric or umbilical arteries to the placenta. Almost immediately after birth the *foramen ovale* becomes closed by a membranous layer, and the *ductus arteriosus* and *ductus venosus* rapidly close and degenerate into impervious fibrous cords. The lungs, previously to the act of inspiration, are dense and solid in structure and of a deep-red color and lie far back in the chest. Their specific gravity is greater than water, in which they (or portions of them) consequently sink, whereas lungs, or portions of lungs, that have respired, float in that fluid.

Children born in the seventh month of gestation are capable of living, although they usually require much care; and children may be born alive at any period after the beginning of the sixth month, or even in some instances earlier than the sixth; but this is rare, and, if born living, they commonly die soon after birth. See GESTATION; EMBRYO; EMBRYOLOGY, HUMAN.

FOG, or MIST (Dan. *fog*, Icel. *fok*, spray, from *fjuka*, to be driven by the wind). Anything that obscures the clearness of the atmosphere, but specifically in meteorology the obscuration caused by the very minute globules of water floating in the air. Because of their minuteness, the fog particles have not sufficient weight to descend rapidly in the presence of the atmosphere; they are not hollow vesicles or spheres having an inherent buoyant gas, as was once supposed, but are upheld by the slightest currents of air; the slowness of their progress downward is due mostly to the viscous resistance or internal friction of the air. These particles of water represent the condensation of vapor that was invisible a short time before. This has been condensed into fog particles, not by coming in contact with or by passing over colder bodies, but either by radiation of heat or by expansion and dynamic cooling. The latter is more frequent in the case of high fogs, but the former in the case of the ordinary fogs at sea level. In general, when a mass of warm moist air rolls over cold land or cold water, it radiates its warmth downward to the colder layers. On the other hand, when cold air flows over warm land or water, the vapor rising from the latter is also quickly condensed, as it cools both by contact and by radiation. Thus fogs are formed over lakes, rivers, and marshes in the evening when the warm vapor from these penetrates the colder air above. Whenever cold dry air from the American continent flows south-eastward over the Gulf Stream, fogs are formed. Or whenever cold and warm streams of water lie adjacent to each other, the air from the warmer, moister region is carried over to the cold water, and cools by radiation until fog is formed. The densest fogs off the eastern coast of New England and Newfoundland come with an east or southeast or southwest wind. Those on the Pacific coast of California come with the west and northwest winds. The light morning fogs over grassy plains and swamps are due to cooling by radiation and occur in still, clear weather within areas of high pressure. In general, every particle of fog has a minute nucleus of dust or germs, or other solid particles, so that it is often injurious to health to inhale it. See DUST.

Electrons and ions have also been found to

serve as condensation nuclei in fog formation, and Barus has made an elaborate study of this phase of the phenomenon. Aitken has also made a recent study of a process wherein the sun's rays themselves seem to initiate dense haze or fog after sunrise where no fog was present before.

Recent studies have brought out the fact that city fogs are more persistent than country fogs; that minimum temperatures are higher in cities than country, due chiefly to the blanketing effect of city fogs; and that city sunlight is much poorer photochemically than the country sunlight. An excellent statement of our knowledge of fogs and a selected bibliography of the subject is given by H. H. Kimball in the *United States Monthly Weather Review*, vol. xlii, pp. 29-35 (Washington, January, 1914).

The fog known as London fog, or dry fog, is due principally to the condensation of aqueous vapor upon the immense number of nuclei floating in the atmosphere as smoke from the soft-coal fires. In London the deaths during foggy weeks always exceed those during pleasant weather. See FOG SIGNALS; HAZE.

FOGARASSY, fô'gô-rôsh-ê, JÁNOS (1801-78). An Hungarian jurist and philologist, born at Kásmark (County of Zips). In 1829 he was admitted to the bar, in 1848 became Councillor in the Hungarian Finance Ministry, and subsequently President of the Council of Commerce and a judge of the Supreme Court. He wrote on Hungarian jurisprudence and finance (*The Hungarian Law of Trade and Exchange*, 1840; *The Hungarian Bank*, 1848), but is best known for the great *Dictionary of the Hungarian Language* (6 vols., 1861-74), prepared under the auspices of the Hungarian Academy of Sciences (from 1861 to 1866 in collaboration with Gergely Czuczor). This work is very inclusive and continues to be regarded as standard, despite the fact that it often is at variance with the principles of modern philology.

FOGAZZARO, fô'gât-tszû'rô, ANTONIO (1842-1911). An Italian novelist and poet, of Vicenza, famous as the most profound representative of the Catholic movement in recent Italian belles-lettres. His earlier works—lyrics, short tales, and a few romances—showed him as a sentimentalist, with some gift for realistic analysis. *Malombra* (1882; trans. by Dickson as *The Woman*, Philadelphia, 1907) was the first of the five romances upon which his international reputation rests: it is a study of psychic pathology executed with romantic weirdness. There is a beautiful lyric splendor in *Daniele Cortis* (1887; trans. by Mantellini as *The Politician*, Boston, 1908): its portrayal of high idealism sustained by indomitable will formed a startling contrast with the sophisticated licentiousness of the Italian exponents of the Superman headed in the eighties and nineties by D'Annunzio. *Piccolo mondo antico* (1895), *Piccolo mondo moderno* (1901), and *Il Santo* (1905), translated respectively as *The Patriot*, *The Sinner*, and *The Saint* (Boston and New York, 1907), by Pritchard, form a trilogy of definitely Catholic *tendenz*. Franco Maironi, a Catholic, finds in his faith a strength to meet the sorrow that crushes his more intellectual wife. Their son Piero survives similarly the disaster that overtakes his married life; and the moral vision he thus acquires not only elevates him beyond secular temptations, but spurs him on to religious rejuvenation of the church. This distinct recognition of good and bad trends

in the Catholic system injected the *Santo* into the modernist question and led to its proscription on the *Index*. The author bowed to the condemnation under a protest which he recorded in *Leila* (1910); though the church have elements hostile to the truth, it still is entitled to the loyalty of true Catholics. Fogazzaro's characters have a substantial truth and vitality that give his romances an important place in modern Italian letters. Consult biography by Molmenti (Milan, 1900); articles by Thayer in the *Nation* (New York, 1911) and McKenzie in *Yale Review* (1912).

FOGBOW. A white halo formed in or on the surface of a bank of fog. See **HALO**.

FOGELBERG, fō'gel-bēr'k, BENGT ERLAND (1786-1854). A Swedish sculptor. He was born at Gothenburg and studied first at the Academy of Stockholm, where he was influenced by Bergell. He then went to Paris (1818) and studied painting under Guérin and modeling under Bosio. Subsequently he went to Rome, where he produced a statue, "Mercury" (1825), which was praised by Thorvaldsen, and his talent won immediate recognition. He was appointed court sculptor by King Charles XIV, and upon his return to Sweden in 1854 he was received with great honor, but his health failed, and at the height of his fame he died suddenly at Trieste on his return to Italy. Fogelberg was one of the first to attempt a plastic representation of the northern gods and, like Thorvaldsen, sought his inspiration in Greek art. In spite of undoubted talent and some originality, his success was only partial, as his "Odin," "Thor," and "Baldur" in the Stockholm Museum testify. He is at his best in classical mythological subjects, such as "Venus Victrix" and "Cupid and Psyche" (both in Stockholm Museum), and in his portrait statues, which include those of Charles XIII, Charles XIV, Gustavus Adolphus (1849), at Gothenburg; and "Birger Jarl" (1853), on the Riddarholm Place, Stockholm. Consult Leconte, *L'œuvre de Fogelberg* (Paris, 1856).

FOGGIA, fō'j'ā. A flourishing city in south Italy, capital of the Province of Foggia, 123 miles northeast of Naples (Map: Italy, E 4). The Norman cathedral, erected in 1179, was partly destroyed by an earthquake in 1731; it was afterward rebuilt in modern style. Piazza Federico Secondo, with its Emperor's Fountain, commemorates the fact that Frederick II was often a resident. In 1240 he held a parliament here. The city has a beautiful customhouse, a theatre, a gymnasium, a technical institute, a school of industry, a city park and botanical gardens, and a library. It is the principal market of the great Apulian plain which produces wine, oil, grain, cattle, and capers. In the country outside of Foggia many sheep graze. Pop. (commune), 1901, 53,161; 1911, 76,688.

FOGHORNS. See **FOG SIGNALS**.

FOGLIETTA, fō-lyēt'tā, UBERTO (1518-81). An Italian historian, born in Genoa, of a noble family, and educated at Padua and Rome. The outspokenness of his first work, *Delle cose della pubblica di Genoa* (1559), caused his banishment from his native city and the loss of his estates, so that he spent the remainder of his life in Rome under clerical protection and devoted himself to literature. Four volumes of his historical essays were published in Rome in 1579, under the title of *Clarorum Ligurum Elogia*. His important *Historie Genuensium*

(1585) was translated by Sardanati into Italian. Consult G. Campori, *Documenti per la vita di U. Foglietta* (Modena, 1870), and articles by A. Neri and R. Renier in *Giornale linguistico* (Genoa, 1877, 1888).

FO'GO (Portug., fire; so called from the volcano in the island). One of the Cape Verde Islands (q.v.), lying west of Santiago. It has an area of 188 square miles and about 16,500 inhabitants. The soil is productive, but the climate is unhealthful. Its volcano is over 9000 feet high. Chief town and port, Nossa Senhora da Luz, or São Filipe.

FO'GO. A port of entry, capital of Fogo Island, at the east-southeast entrance to Notre Dame Bay, Newfoundland, 165 miles northwest by north of St. John's (Map: Newfoundland, F 3). It is a fishing and trading port. Pop., 1901, 1118; 1911, 1152.

FOG SIGNALS. The chief use of fog signals is to give warning to approaching vessels when not in sight of one another, to enable them to continue their respective courses after having first localized the direction and distance of the neighboring ship. In addition, fog signals are most useful indications of dangers to vessels approaching headlands or feeling their way through narrow channels.

In considering the first-mentioned use of the fog signals, the International Marine Conference, held at Washington in 1890, concluded that all steam vessels should be provided with an efficient whistle or siren, sounded by steam or some substitute for steam, so placed that the sound is not interrupted by any obstruction, and having an efficient foghorn to be sounded by mechanical means, and also an efficient bell. In fog, mist, falling snow, or heavy rainstorms, whether by day or night, the following signals are to be used: A steam vessel having way upon her is to sound a prolonged blast at intervals of not more than two minutes. A steam vessel under way, but stopped and having no way upon her, is to sound at intervals of not more than two minutes, two prolonged blasts, with an interval of about one second between them. A sailing vessel under way sounds at an interval of not more than one minute, one blast when on the starboard tack, two blasts in succession when on the port tack, and three blasts in succession with the wind abaft the beam. A vessel at anchor is to ring her bell rapidly for about five seconds at intervals of not more than one minute. When a vessel anchors in other than ordinary anchorages, and is in danger of being an obstruction to vessels under way, if a steam vessel, she must sound two prolonged blasts with her whistle or siren, with not more than a two minutes' interval, followed by ringing her bell; if a sailing vessel, at intervals of not more than one minute, two blasts with her foghorn, followed by ringing her bell. A vessel when towing, at intervals of not more than two minutes, sounds three blasts in succession, viz., one prolonged blast followed by two short blasts. A vessel towed can give this signal, but she cannot give any other. When one steam vessel wishes to indicate to another that she can feel her way past, she can do so by sounding a short blast, followed by a long and a short, with intervals of about one second between them. A cable ship, at work, hearing another vessel's fog signal, answers it with three prolonged blasts in succession.

Sailing vessels and boats of less than 20 tons'

gross tonnage are not obliged to give the signals required of large sailing vessels; but if they do not they are to make some other efficient sound signal at intervals of not more than one minute. Every vessel in foggy, misty weather, or in snow or heavy rainstorms, is obliged by the rules adopted to go at a moderate speed, having careful regard to the existing circumstances and conditions. When a steam vessel hears, forward of her beam, the fog signal of a vessel, the position of which is not ascertained, she must, as far as the circumstances of the case admit, stop her engines and then navigate with caution until danger of collision is over.

The international rules apply to deep-water navigation throughout the world. In addition, nearly all nations have prescribed rules for their inland waters. These do not differ in general principle from the deep-water rules, but the details are frequently much amplified and adjusted to the particular needs of the vessels plying the waters in question. In inland rules the time between signals is usually reduced. Thus, under the United States inland rules steamers must sound their whistles every minute instead of every two minutes, as required by the international rules.

Experiments made in Holland on the force and duration of sound signals show that a steam whistle two inches in diameter requires a pressure of about two atmospheres in order to make the sound heard at the distance of 1 kilometer (0.62 mile); whereas a steam whistle of 6 inches' diameter, with a pressure of six atmospheres, makes its sound heard about 14 kilometers (8.68 miles). If, however, the whistle be placed in a horizontal position within a reflector, the 2-inch whistle can be heard at 4 kilometers (2.4 miles), which is about the same distance that a vessel's side lights are visible. With a bell of 8 inches' diameter sound travels only 600 meters (1868 feet), and it requires a bell of a weight of 80 kilograms (about 176 pounds) to transmit the sound 1500 meters (4920 feet). The sound of a movable bell (i.e., when the tongue or clapper is fixed) travels farther than when the reverse is the case.

On many points along the coast, in the light-houses and on lightships, steam whistles and horns of great power have been placed, and also bells that are rung mechanically, which are sounded whenever the state of the atmosphere requires it to be done. The simplest and commonly most powerful signal employed by the United States Lighthouse Service is the locomotive whistle, operated by a steam boiler with a pressure of from 50 to 75 pounds. The sounds from the land are distinguished from those on board ship by the length of the notes and the intervals between. The whistles are from 8 to 10 inches in diameter and are operated automatically by an engine supplied with steam from the same boiler. The Daboll trumpet, worked by condensed air, is next in importance. The trumpet itself provides the resounding cavity, and the vibratory motion of the air is produced by a "reed." The reed is an iron bar, in the larger trumpets being 18 inches long, 2 inches wide, and $\frac{3}{4}$ of an inch thick, gradually lessening towards the free end. The siren trumpet is the most powerful instrument so far employed. (See SIREN.) The impulse to the air which produces the sound is given by a flat drum, or a hollow cylinder with a short axis, one end of which is perforated to admit

steam. On the other side the drum is perforated with eight or more holes, in connection with which is a revolving disk having a similar number of holes. As the disk revolves, these eight holes are alternately open and shut, allowing egress to as many jets of steam, which provides a regular and violent motion in the air, giving rise to a most powerful sound, reinforced by the resonance of a trumpet of suitable length. In still air this sound can be heard from 20 to 30 miles, even during a dense fog. The notes are not all to be heard at the same distance, however, and an opposing or crossing wind seriously interferes with the transmission of sound. The intervention of rain, snow, or mist also disturbs and retards, and temperature has a distinct influence. Whistling buoys and bell buoys are also largely used to mark dangers or channels, and are of great assistance in determining the whereabouts of a vessel in thick weather. For a thorough discussion of various forms of fog signal, the reader is referred to Johnson, *Modern Lighthouse Service* (Washington, 1889).

Railway trains depend largely upon torpedoes to indicate the too close approach of one train to another. The torpedoes are small, flat tin cases charged with a detonating powder which are exploded by the wheels of the passing train and make a loud report. These are not only used in foggy weather, but also when there is any obstruction along the line that would expose approaching trains to danger of collision, derailment, or any similar accident.

While fog signals have been made which may be heard at considerable distances, yet the apparent directions from which they come are often deceptive, and much of the good which might otherwise be accomplished by these signals is rendered nugatory because of the difficulty of locating exactly their direction. This has been to a considerable extent obviated by the invention of the topophone by Col. D. P. Heap, Corps of Engineers, U. S. A. This instrument not only assists in hearing sounds at greater distances than is possible with the unassisted ear, but also assists in locating with more exactness the direction from which the sound comes.

FIG. 1. TOPOPHONE.

It consists of two acoustic receivers or trumpets pointing in opposite directions and supported on a vertical shaft. (See Fig. 1.) From the lower ends of the trumpets extend rubber tubes connected with the ears by especially constructed earpieces.

The observer holds the shaft so that the instrument is above his head (see Fig. 2); if the sound is heard in the right ear, it shows at once that the noise must be somewhere on his right side. By oscillating the trumpet so that the sound is heard alternately in each ear, the sound will be in the direction inside of the angle

of oscillation; this angle is generally about one point of the compass. The operation is simple and takes but a few seconds.

FIG. 2. METHOD OF USING TOPOPHONE.

The direction of the sound being once ascertained, the observer can readily keep the topophone pointed in this direction. Knowing the speed of the vessel and its course, the location of the sound can be quickly plotted accurately enough for practical purposes.

While the topophone above described aids to ascertain the direction of the sound, various attempts have been made to have direct indications of the approximate direction of the sound by varying its character for different points of the compass. The Foster fog signals, which have been adopted by the United States Lighthouse Service, are designed to accomplish this and are at times of much assistance to navigators. The apparatus is a species of sound director, which concentrates and projects

The sound director consists of eight stationary megaphones, each being directed to one of the points of the compass, as shown in the illustration. It is also made of a single automatic revolving megaphone, which emits the appropriate sound on arriving at each point of

FIG. 4. SIGNAL CODE.

Dots denote short blasts, and dashes long blasts.

the compass. Different points of the compass are indicated by a simple code of long and short blasts, the opposite points of the compass being in each case reversed; e.g., north is one long blast, south is one short blast, west is a short blast and a long blast, and east is a long blast and a short blast. The signals for the different points of the compass are indicated on the accompanying diagram (Fig. 4).

The diagram Fig. 5 shows the relation of the sounds as between two passing vessels.

When two signals are heard with equal clearness, both louder than the following one, the direction of the danger must be midway between the points which are heard with equal distinctness. These signals may be placed on shore at

FIG. 3. LIGHTHOUSE MACHINE, WITH FIVE-FOOT MEGAPHONE.

various signals, first in one direction and then in another, varying the signal sound according to the direction to which it is sent. A passing vessel may therefore hear one of these sounds more clearly than the other, and the signal heard most distinctly indicates a close approximation to the exact direction from which the sound comes.

lighthouse stations and ferry slips, etc., aiding in the latter case the facility of a ship's attaining its proper slip, even in very foggy regions, provided there are no other slips in the vicinity or so many moving vessels as to cause a confusion of signals. The method adopted for this purpose is indicated in Fig. 6.

The submarine bell signal apparatus is now much used for determining direction in fogs. It consists of a bell which is rung under water from a lightship or buoy and is operated by pneumatic mechanism or the waves in buoys too

FIG. 5. RELATION OF SOUND BETWEEN TWO VESSELS.

far from shore to be connected by an electric cable. The receiving apparatus is placed against the inner side of the side plating on each side of the bow of a ship. It consists of a small cast-iron tank (placed well below water) which contains two microphones. The sounds of the bell, coming through the water, enter the water of the tank and are picked up by the microphones, which in turn transmit them to the indicator box in the pilot house or chart room. Switches in the indicator box enable the observer to listen alternately to the port and starboard microphones and determine by the relative loudness on which side the sound is coming from. By changing the heading of the ship the approximate direction of the sound is ascertained. Very many of the larger vessels of the mercantile marine and the navy are equipped with the receiving apparatus, as are the important light-vessels and fog-signal stations.

Notwithstanding the efforts made to ascertain directions in a fog, at times all means

FIG. 6. FOG SIGNAL ON FERRY SLIP.

fail. There are conditions under which the sound seems to be deflected and appears to come from some other than the true direction or from a direction impossible to define. Under other conditions the sound is greatly reduced or absolutely nullified in certain directions or over certain areas while audible at greater or less distances and in other directions. These

temporary areas of "silence" are often quite close to the source of sound.

In the navy it is frequently necessary for the fleet to cruise in formation during a fog. As the vessels are out of sight of each other in dense fogs, a *towing spar* is fitted. This consists of a wooden float so built as to throw a certain amount of spray and otherwise show a definite wake and is towed at the end of a line of such length that it is only a few yards from the bow of the following ship. At night and sometimes during the day searchlights are used to give the direction to the following ship. In very thick fogs their use has proved very successful in enabling a ship to keep at a proper distance from and directly behind the ship ahead, each ship turning her searchlight directly astern. The light is clearly discernible even in the thickest fogs from a ship not more than 400 or 500 yards away.

Radio (wireless) telegraphy is being used to determine positions in fogs, especially as regards the courses of approaching vessels, and much information concerning weather, fogs, and dangers to navigation is spread broadcast from light vessels and stations. Attempts are being made to determine directions and distances in fogs by means of radio signals, but definite success has not yet been attained.

Consult: Joseph Henry, *A Summary of Researches in Sound* (Washington, 1879); A. B. Johnson, *Aberrations of Audibility of Fog-Signals* (ib., 1885); W. R. Livermore, *Report upon Fog-Signal Experiments* (ib., 1894); Alfred Hiebel, *Seezeichen, Leuchtfeuer und Schallsignale des atlantischen Ozeans* (Hamburg, 1908).

FO-HI, fō'hē. See FV-HI.

FÖHR, fēr. One of the North Frisian Islands, situated in the North Sea, off the west coast of Schleswig (Map: Prussia, C 1). Area, about 32 square miles. The surface is partly elevated but mostly wooded marshland, the northern part being protected by a dike. The soil is productive. The population numbers about 4500, mostly Frisians speaking the North Frisian language. The chief occupations are fishing, hunting, and seafaring. The chief town is Wyk, a bathing resort on the east coast. Consult Philippsen, *Kultur und Naturbilder von Föhr* (Wyk, 1902).

FOIL (OF. *foil*, *fuel*, *feuille*, Fr. *feuille*, leaf, from Lat. *folium*, Gk. *φύλλον*, *phyllon*, leaf). In architecture, the concave curve connecting any two cusps (q.v.) in a cusped arch or tracery circle. A *trefoil* arch or circle is one having three cusps and foils, inclosing a three-lobed opening; a *quatrefoil*, one with four lobes: *cinqfeuil*, *seafoil*, *eightfoil* designate five, six, and eight lobes respectively. The foiling of Gothic arches and tracery is found in all the styles and by its character forms one of the marks of the style and period; it appears occasionally even in late Romanesque work, in which the foils are always round. Moorish arches are often numerously and minutely foiled. See ARCH; CUSP; TRACERY.

FOIL. A general name for thin metal intermediate in thickness between *leaf metal*, such as gold, silver, and copper leaf, and *sheet metal*. There are two distinct kinds of foil in common use: the very thin tinfoil used in chemistry, for electrical apparatus, and formerly for coating the backs of mirrors (q.v.); and the brighter, thicker foils, which, under the name of "tinsel," are made of copper, tin, tinned copper, or sil-

vered copper, and are used by jewelers for theatrical and other ornaments. The foils used by jewelers for backing gems, sometimes called *Dutch foils*, consisting of small sheets of silvered copper rolled very thin, are colored with the following preparations, to suit the different gems under which they are to be placed, or for use as tinsel in the manufacture of theatrical ornaments, toys, etc.: Lake and Prussian blue, and pale drying oil finely ground with a slab and mullar—for amethyst color. Prussian blue similarly prepared—for sapphire color. Dragon's blood dissolved in pure alcohol—for garnet color. Ferrocyanide of iron and bichromate of potash, equal parts, very finely ground and sifted, then ground with a quantity of gum mastic equal to the other two ingredients, until the whole forms an impalpable powder; gradually form this into a thin paste with pure wood alcohol and preserve in a stoppered bottle; when used, a portion is diluted with wood alcohol to the necessary thinness—for emerald color. Various shades of yellowish or bluish green can be produced by varying the proportions of the two coloring materials. Lake or carmine ground in solution of isinglass—for ruby color. A weak solution of orange shellac, sometimes tinted with saffron, turmeric, or aloes—for topaz color. Several other color varnishes are made by similar methods for various shades of tinsel and gem foils.

Gold foil is chiefly used by dentists for filling teeth and differs from gold leaf only in being a little thicker. (See *GOLD BEATING*.) Commercial *tin foil* is largely adulterated with lead and is used as a wrapping for tobacco, chocolates, and bonbons, toilet and other fancy articles. *Variegated foil* is made by laying 30 or 40 thin plates of gold, silver, copper, and various alloys in a regular order and then soldering the edges. A pattern of various depths is punched, and the metal hammered out into a thin sheet. The punch marks disappear, and the pattern, appearing sometimes in one and sometimes in another of the metals and much spread out, is very effective. It is suggestive of damaskeening on metal. See *DAMASKEENING*.

FOIL (probably from *foi*, to blunt, from OF. *fouler*, *foler*, *foler*, Fr. *fouler*, to trample, from ML. *fullare*, to full cloth by trampling, from Lat. *fullo*, fuller). A weapon used in fencing as a substitute for the short sword. See *FENCING*.

FOIX, fwä (Lat. *Fuavum*). The capital of the Department of Ariège, France, situated on the left bank of the river Ariège, 51 miles from Toulouse (Map: France, S., F 6). It has a picturesque old castle, with three well-preserved towers of white marble, dating from the twelfth and fourteenth centuries, and the old church of Saint-Volusien of the twelfth century. It has a lyceum, library, museum, and teachers' training school, also several large iron and steel works, and trades in flour, wool, cattle, resin, and iron. Foix was the capital of the old Countship of Foix. Pop. (commune), 1901, 7065; 1911, 6806.

FOIX. An old French family, which took the title of Count from the District of Foix.—The first who bore the title was ROGER, in the early years of the eleventh century.—RAYMOND ROGER, Comte de Foix, figures as one of the knights who accompanied Philip Augustus to Palestine; he died in 1223.—GASTON III, Comte de Foix, called Phoebus, married Agnes, daugh-

ter of Jeanne II, Queen of Navarre. He was a skillful warrior and fond of the chase. He wrote a work on the latter subject, which was greatly admired in the fifteenth century. Froissart (q.v.) owed some of the choicest incidents in his chronicles to having lived for some time in the castle of Orthes, Gaston's principal residence. After his death, in 1391, the estates and title went to a collateral branch of the family, as in a fit of anger he had killed his only legitimate son.—GASTON IV, Comte de Foix, rendered good service to the King in the wars against England. He died in 1472.—Gaston's grandson, GASTON DE FOIX, Duke of Nemours, was the son of Gaston de Foix, Comte d'Estambes, and of Marie d'Orléans, sister of Louis XII of France, and was born in 1489. In the Italian wars carried on by Louis, Gaston displayed the most brilliant and precocious genius. He was everywhere successful by the rapidity of his movements, which obtained for him the title of the *Thunderbolt of Italy*. He won the great battle of Ravenna over the Spaniards, April 11, 1512, in which, however, he fell, at the early age of 23. Consult Castillon, *Histoire du comté de Foix* (Toulouse, 1852), and Vic et Vaissette, *Histoire générale de Languedoc*, vol. iv (ib., 1872).

FOIX, ODET DE. See LAUTREC.

FOIX, PAUL DE (1828-84). A French ecclesiastic and diplomat. He studied in Paris and Toulouse and lectured on civil law. At the age of 19 he became a councilor of the Parliament of Paris. Through the favor of Catharine de' Medici he rose rapidly to power. As ambassador to England, he endeavored to bring about the marriage of Elizabeth to the Duke of Anjou. Later he was Minister at Venice, Florence, and Rome, and Plenipotentiary at the court of Henry of Navarre. He was made Archbishop of Toulouse in 1577 and was sent to Rome in 1579 as Ambassador, where he died, in 1584.

FO-KIEN, fō'kě-ên'. See FU-KIEN.

FOKSHANI, fōk-shā'ně (Rum. *Focsani*). A town of Rumania in Moldavia, situated on the Milkov, a branch of the Sereth, 47 miles west-northwest of Galatz (Map: Balkan Peninsula, F 2). The vineyards in its neighborhood produce one of the best kinds of Moldavian wines, and the town carries on a considerable trade in grain with Galatz. In 1789 Fokshani was destroyed by the Russians. It was burned by the Turks in 1822. Pop., 1899, 23,783, including about 6000 Jews; 1905, 24,183.

FOL, fōl, HERMANN (1845-92). A Swiss zoologist. He was born in 1845, of German parents, and lost his life at sea in 1892. He took a medical degree in Berlin in 1869, but devoted himself to zoölogical studies. He was especially interested in the investigation of marine animals and, being a man of wealth, was able to indulge his tastes by establishing a marine laboratory at Nice and visiting in his yacht the waters of various countries. His home was in Geneva, where for nine years he was professor of zoölogy. The following are among his more important works: *Die erste Entwicklung des Geryonideies* (1875); *Etudes sur le développement des mollusques* (1877); *Sur le commencement de l'hénogonie chez divers animaux* (1879); *Lehrbuch der vergleichenden mikroskopischen Anatomie* (1884); *Recherches sur la fécondation et la commencement de l'hénogonie* (1891); *Le quadrille de centres* (1891).

FOLARD, fô'lâr', JEAN CHARLES, LE CHEVALIER DE (1669-1752). A French soldier and writer on military affairs, born at Avignon. He entered the French army and fought in several campaigns in the wars of Louis XIV. Later he enlisted in the service of Charles XII of Sweden and particularly distinguished himself at the siege of Frederikshald in 1718. His works include *Nouvelles découvertes sur la guerre* (1724) and *Commentaire sur Polybe* (6 vols., 1727-30), a work once much read and widely discussed, of which Frederick the Great prepared a résumé, *Esprit du chevalier de Folard* (1760; an unauthorized publication). He urged the superiority of column over line formation for attack and defense, but his theories meet with little approval, Marshal Saxe being the principal exception. Consult his *Mémoires* (Paris, 1753).

FOLCLAND, fôlk'lând (AS., folkland), or **FOLKLAND**, fôk'lând. The land of the folk, or the people of England in Anglo-Saxon times; the public domain. All land the title to which was not attested by charter, whether in private hands or not, was folkland or public land. It comprised the whole area of England that had not been assigned to individuals or communities at the first allotment and that was not subsequently divided into estates of bookland. It constituted in England a permanent source of revenue, for it could not be alienated without the consent of the National Council, differing in this respect from the public lands of other Germanic tribes; thus, the Lombards had public or state lands, but the pleasure of the King determined their disposal, while in England the King himself could not appropriate a part of the folkland without the consent of the Council. The English folkland had only an analogy, and not a similarity, to the common lands of the township in the mark system of the Teutonic races. The ownership continued to reside in the state, and the individuals who held portions, for which they paid rent and service, held only for life. The holders of folkland were liable to special burdens of a feudal character due directly to the state, and royal offices administered the jurisdiction. Such were the characteristics of the folkland down to the time of King Alfred. From his time the records contain less and less frequently the clause expressing the consent of the National Council to the alienation of the folkland. Gradually that body became only witnesses of the transaction, which received their attestation. Ultimately the folkland became hardly distinguishable from the royal demesne. Consult: Stubbs, *Constitutional History of England* (Oxford, 1874-78); Taylor, *The Origin and Growth of the English Constitution* (New York, 1898); Turner, *History of the Anglo-Saxons* (London, 1836).

FOLCMOT, fôlk'môt (AS. *folcgemôt*, from *folc*, folk + *gemôt*, meeting, from *mētan*, OS. *mōtjan*, Dutch *moeten*, to meet), or **FOLKMOOT**. In early Anglo-Saxon England a national assembly or council. Later it came to be the assembly of the shire, composed of the representatives of the hundreds and townships. It met twice a year and was presided over by the Ealdorman, or the sheriff. In it cases concerning important persons and lawsuits between parties from different hundreds were tried, and questions of making war or peace were decided. Both lay and ecclesiastical cases were brought before

it, and consequently the Bishop was present. It was also called a shire moot.

FOLDING OF ROCKS. See GEOLOGY.

FÖLDEVÄR, fêld'vär. See DUNA-FÖLDEVÄR.

FOLENGO, fô-lên'gô, TEOFILO. See MERLINO COCCAJO.

FOLEY, JOHN HENRY (1818-74). An Irish sculptor. He was born in Dublin, May 24, 1818, and studied at the Dublin Society of Art and afterward at the Royal Academy, London. He made a decided reputation by his "Ino and Bacchus," in 1840. The works of his earlier period are chiefly of an ideal character and possess rare grace and freshness of conception for that day. Among the best of them are the "Youth at the Stream" (1844), "Mother" (1851), the "Elder Brother in Comus" (1860). "Egeria" (1856) and "Caractacus" are both in the Mansion House, London. He excelled, however, in his portrait statues, which are noted for their strength of characterization. Among them are those of Hampden (1844), Selden, and Sir Charles Barry, for the Houses of Parliament; the colossal bronze equestrian statue of Lord Hardinge, and those of Lord Canning and Sir James Outram, produced for Calcutta; Lord Clive, produced for Shrewsbury; Oliver Goldsmith, Edmund Burke, O'Connell, and Gough, at Dublin; Father Mathew, at Cork; John Stuart Mill, on the Thames Embankment; the group "Asia" and the "Prince Consort" for the Albert Memorial near Hyde Park. The best of these works are perhaps the three Indian notables at Calcutta, especially Outram. During the Civil War Foley designed the seal of the Confederate States of America. His last work was a bronze statue of Stonewall Jackson, for Richmond, Va. He died at Hampstead, Aug. 27, 1874. He was made an associate of the Royal Academy in 1849 and a member in 1858. Consult Monkhouse, *The Works of J. H. Foley* (London, 1875).

FOLEY, SIR THOMAS (1757-1833). An English admiral. He entered the navy at the age of 13 and served on the *Otter* in Newfoundland. In 1774 he went to Jamaica and saw a good deal of service there against privateers; in 1778 he was made lieutenant and sent to America, under Lord Longford, and a year later took part in the Spanish campaign which terminated in the relief of Gibraltar. After service in America again, in the West Indies, and off Toulon (1793-95), he took part in the battle of the Nile (1798) and was with Nelson in the Baltic in 1801. In 1808 he became rear admiral; in 1812 was vice admiral; admiral in 1820, and in 1830 commander in chief at Portsmouth, where he died three years later. Consult Herbert, *Life and Services of Admiral Sir Thomas Foley* (Cardiff, 1884).

FOLGER, fôl'jër, CHARLES JAMES (1818-84). An American jurist and politician. He was born at Nantucket, Mass., graduated at Hobart College in 1836, and after 1840 practiced law at Geneva, N. Y., and was elected county judge of Ontario County in 1851. He was State Senator from 1861 to 1869, during which time he served as chairman of the Judiciary Committee, and for four years was president pro tempore. He became associate justice of the New York Court of Appeals in 1871 and in 1880 succeeded Judge Church as Chief Justice. He was Secretary of the Treasury in President Arthur's cabinet from 1881 until his death. As the Republican nominee for Governor of New York in 1882, at a

time when the party was seriously divided, he was defeated by Grover Cleveland by an overwhelming majority.

FOLGER, HENRY CLAY, JR. (1857-). An American capitalist, born in New York City. He received the degrees of A.B. in 1879 and A.M. in 1881 from Amherst College, and LL.B. (1881) from Columbia University. He was connected with the Standard Oil Company of New Jersey from 1879 to 1911, when he became president of the Standard Oil Company of New York. He was also chosen president of the Atlantic Refining Company and the Solar Refining Company and director of the Union Tank Line, the Tide Water Oil Company, and the Tide Water Pipe Company. He wrote several monographs on Shakespeare and collected a library of Shakespeareana, comprising some 20,000 volumes. In 1914 he received the degree of Litt.D. from Amherst College.

FOLGER, PETER (1617-90). An American colonist and clergyman. He was born probably at Norwich, England, and in 1635 settled in Watertown, Mass., whence he seems to have removed to Martha's Vineyard in 1641, where he was occupied as a school-teacher, a land surveyor, and an assistant to Thomas Mayhew in missionary work among the Indians. About 1663 he removed to Nantucket, where he acted as surveyor and interpreter, and for a short time as clerk of the courts. His daughter Abia was the mother of Benjamin Franklin. Folger was the author of a crude but vigorous work in verse, *A Looking-Glass for the Times; or, The Former Spirit of New England Revived in this Generation* (1676; reprinted, 1883), in which, addressing himself to the governors of the Colonies at the time, he advocates liberty of conscience and toleration of the Anabaptists, Quakers, and sects which had hitherto suffered persecution, and asserts that King Philip's War and other calamities are to be regarded as judgments of God for the absence of such toleration in the past. A reprint may be found in Stedman and Hutchinson, *Library of American Literature*, vol. 1 (New York, 1887).

FOLGER, WILLIAM MAYHEW (1844-). An American naval officer. He was born at Massillon, Ohio, and graduated from the United States Naval Academy in 1864. After serving in the various lower grades he became captain in 1898 and rear admiral in 1904. His commands include the *Quinnebaug* (1887-88), the *Yorktown* (1894-95), the *New Orleans* (1898-99), and the *Kearsarge* (1900-01). He was inspector of ordnance at the Washington Navy Yard in 1888-90, chief of the Bureau of Ordnance with the rank of commodore in 1890-93, and lighthouse inspector in 1896-98 and 1901-04. He also commanded the Philippine squadron in 1898 and until 1905 the Cruiser squadron of the Asiatic fleet, and the whole fleet at the time of his retirement in 1905.

FOLGORE DA SAN GEMINIANO, fôl'gô-râ dà sãn jã'mě-nyã'nô. An Italian poet, who flourished about the close of the thirteenth century. Of his life little is known. He was a contemporary of Dante and a writer of sonnets, some of which have been translated into English by D. G. Rossetti and J. A. Symonds. He wrote a series of anti-Ghibelline political sonnets, which are of interest from their allusions to Italian life and society of the day, and two other series celebrating with Epicurean gayety the pleasures of the months and the days of the

week. These latter are remarkable for their curious imagery and gentle satire and possess added interest from their relation to the joyous company described in Dante's *Inferno* (xxix, 130). Consult Rossetti, *Dante and his Circle* (London, 1874), and Navone, *Le rime di Folgore* (Bologna, 1880).

FOLIATION, fô'lî-a'shûn (from ML. *foliare*, to put forth leaves, from Lat. *folium*, Gk. φύλλον, *phyllon*, leaf). In geology, a term used to designate a parallel arrangement of mineral constituents in rocks, as in gneisses and schists. By some geologists it is distinguished from cleavage, schistosity, or slatiness; but this distinction is not based on essential differences. The foliation, or parallel arrangement, is most noticeable in the metamorphic rocks which have undergone powerful compression and which contain platy minerals like the micas. See CLEAVAGE; SCHISTOSITY.

FOLIES-BERGÈRE, fô'lê' bër'zhâr'. A well-known amusement hall on the Rue Richer, Paris. It was founded in 1869 as a variety theatre and offers musical and acrobatic performances, dances, and similar entertainment.

FOLIGNO, fô'lê'nyô (Lat. *Fulginium, Fulginia*). An episcopal city in the Province of Perugia, central Italy, on the Topino, 771 feet above sea level, 80 miles southwest of Ancona (Map: Italy, D 3). In the Pinacoteca are Roman reliefs and paintings by Umbrian masters; in the church of Santa Maria infra Portas, which has an eighth-century portico, are numerous frescoes of the fifteenth century by Niccolò da Foligno, who was born here and was the head of the Foligno school of painting; in the church of San Niccolò are an altarpiece representing the Nativity and a "Coronation of the Virgin" by the same artist. The cathedral of San Feliziano has a thirteenth-century portal, fifteenth-century frescoes, and a few ninth-century columns. Near it the Orfini Palace contains a fresco by Perugino. Raphael's Madonna di Foligno, now in the Vatican, was painted for the church of St. Anna. In Bevagna, 5 miles to the west, are two twelfth-century churches, one of which has been restored as a national monument, and in the churches of the neighboring Montefalco are many of the best paintings of the Umbrian school. In Trevi, the ancient Trebia, 5 miles south of Foligno, there are also important paintings. Foligno has a large theatre, a gymnasium, a technical school, a seminary, and a chamber of commerce. It markets silk and oil, and manufactures machinery, leather, paper, and soap. The city was destroyed by the Perugians in 1281 and was ruled by the Trinci from 1305 to 1439, when it was annexed to the States of the Church. It was badly damaged by an earthquake in 1832. Pop. (commune), 1901, 26,111; 1911, 28,373.

FOLIO (Lat., abl. sing. of *folium*, leaf). A sheet of paper that is folded once, or of a size convenient for so folding. Also a book formed of sheets so folded as to make two leaves. See Book.

FOLIUM (Lat., leaf). A curve first studied by Descartes (q.v.). Its equation in rectangular coördinates is $x^2 + y^2 - 3axy = 0$; hence the curve is of the third order. (See CURVE.) The origin is a double point, and the axes of coördinates are the tangents at this point. See figure, which shows the leaf-shaped loop which gives the curve its name.

The line $x + y + a = 0$ is an asymptote (q.v.), and its infinite point of contact is a real point of inflection.

FOLK, JOSEPH WINGATE (1869–). An American lawyer and public official, born in Brownsville, Tenn. He graduated at Vanderbilt University in 1890, was admitted to the bar in the same year, and as circuit attorney (1900–04) became prominent for the vigor of his prosecution of bribery cases. He was elected Governor of Missouri in 1904 on the Democratic ticket—the only successful candidate on the State ticket—and in his term (1905–09) was active in the campaign against trust abuses. He was talked of in Missouri for the Democratic nomination for the presidency in 1912, but withdrew in favor of Champ Clark. In 1913 President Wilson named him solicitor of the Department of State, and in February, 1914, he was appointed counsel of the Interstate Commerce Commission.

FOLKES, fōks, MARTIN (1690–1754). An English antiquary, born in London, and educated at Clare College, Cambridge. While still young, he was elected a member of the Royal Society, and in 1741 he was chosen president. He was also president of the Antiquarian Society from 1749 until his death. He was a friend of Sir Isaac Newton and was distinguished for his extensive information. The works entitled *A Table of English Gold Coins from the Eighteenth Year of King Edward III and A Table of English Silver Coins from the Norman Conquest to the Present Time* were published by him at his own expense (1745) and reprinted by the Society of Antiquaries in 1763. He also contributed valuable papers on Roman antiquities to the *Transactions* of the Royal and Antiquarian societies.

FOLKESTONE, fōk'stōn. A seaport and municipal borough in Kent, England, on the Strait of Dover, 7 miles west-southwest of Dover (Map: England, H 5). It is an ancient town, with Roman, Saxon, and Norman remains, and is built on uneven ground at the foot of a range of hills, the oldest part lying in a narrow valley crossed by a fine railway viaduct. Its extension and improvement date from the opening of the South-Eastern Railway, the establishment of a daily steamer service with Boulogne, and the enlargement of the harbor. It has important fishing interests and a considerable shipping trade, the total value of its imports and exports for 1912 amounting to \$98,686,000. Folkestone has a promenade pier, amusement pavilion, and pleasure gardens, museum, and free library, and is a favorite sea-bathing resort. The electric-lighting and tramway service are furnished by a private company operating under an agreement with the corporation. The parish church,

renovated and restored, was the priory church of St. Eanswith, built in 1095. A monument to Sir William Harvey (q.v.), discoverer of the circulation of the blood, born here in 1578, was erected in 1881. Pop., 1901, 30,694; 1911, 33,502.

FOLKLAND. See FOLCLAND.

FOLKLORE. The learning of the uncultured; a branch of study that relates to traditional beliefs, old-time customs, usages, or observances preserved generally among the common people, and collects legends, myths, tales, folk songs and superstitions for the purpose of record and comparison. Oral tradition and unwritten practice are important elements in matters of folklore, and a certain amount of obsolescence or obsolescence is characteristic of the subjects that come under consideration, for the learning of to-day becomes the lore of tomorrow, so that a full knowledge of the folklore of every nation of the world would be synonymous with the history of human thought. The word "folklore" as a designation is comparatively modern; it was first suggested by W. J. Thoms, in an article in the *Athenæum*, Aug. 22, 1846, as a connotation for what is often called popular antiquities.

With regard to its antiquity folklore studies date back as far as antiquarians themselves. The ancient Hindus, in their *Itihāsa* legends of the Vedas, and the Sanskrit myths and sagas of the *Purānas* (q.v.), recognized the fact, if not the form, of the study; and Herodotus and Livy were not blind to certain historic and traditional features in stories and observances among the common people which we to-day would chronicle as elements of folklore. But as a serious branch of investigation the study is comparatively recent. Yet we can recognize it distinctly, in spirit at least, as early as the opening of the eighteenth century. One of the first books of the kind to which we may point in England is Aubrey's *Miscellanies*, published in 1696. This contained much folklore material, as the work had chapters on day fatality, omens, dreams, corpse candles, second sight, and kindred subjects; but the author himself was much given to superstition, and he attached especial prominence to that phase of thought in the book. The first real work on the general subject of folklore was an octavo volume by the Rev. Henry Bourne, *Antiquitates Vulgares; or, The Antiquities of the Common People* (Newcastle, 1725). It consists largely of an account of popular customs connected with the feasts of the church. Addison, the essayist, also gave some attention incidentally to subjects in the line of folklore; but a marked step in advance was made when Brand's *Popular Antiquities of Great Britain* was issued at Newcastle in 1777, and became a standard work that has often been republished and revised. In Germany Herder and the brothers Grimm were pioneers in the way of folklore studies and were followed by such men as Adelbert Kuhn, Mannhardt, W. Schwartz, and Weinhöld; for scientific method was brought into the study by the school of German workers. Among the Latin races the French point to the names of Ballard and Moncrief, Spain to Fernán Caballero and Machado y Alvarez, Italy to De Gubernatis and others, as interested in this theme; so that to-day every country in Europe, including Greece, has some laborers in this department, or supports a regular journal and series of publications connected with folklore topics.

In America especially there has been increasing interest in researches into the popular and traditional knowledge of the folk, because of the exceptional opportunities for studying the more or less savage and crude mass of primitive ideas and notions existing among the Indian tribes or preserved by the negro population. So widespread throughout the world is the interest in folklore that there is hardly a civilized or uncivilized race that has not received direct or indirect attention from some worker in the field. Associations for the study of folklore, like the English Folklore Society, founded in 1878, the French society for the study of popular traditions, with its *Revue des traditions populaires* (Paris, 1886-), the American Folklore Society, founded in 1888, and many others, these have helped largely to lift folklore studies out of the mere antiquarian stage and to make them a valuable auxiliary in anthropological and ethnological investigations.

As a branch of research, folklore is extremely comprehensive in its scope. Some idea of its breadth may be gathered from the following scheme of groups and subgroupings of topics arranged by the London Society of Folklore in its *Handbook*. The outline is as follows:

IDEAS AND SUPERSTITIOUS BELIEFS

1. Superstitious belief and practice.
2. Superstitions connected with great natural objects.
3. Tree and plant superstitions.
4. Animal superstitions.
5. Goblins.
6. Witchcraft.
7. Leechcraft.
8. Magic and divination.
9. Beliefs relating to future life.
10. Superstitions generally.

TRADITIONAL CUSTOMS

11. Festival customs.
12. Ceremonial customs.
13. Games.
14. Local customs.

TRADITIONAL NARRATIVES

15. Nursery tales or Märchen; hero tales; drolls; fables and apologues.
16. Myths, relating to creation, deluge, fire, and doom.
17. Ballads and folk songs.
18. Place legends and traditions.

FOLK SAYINGS

19. Jingles, nursery rhymes, riddles, etc.
20. Proverbs.
21. Nicknames, place rhymes.

The themes of folklore may be: (1) cosmic phenomena and origins; (2) the heavenly bodies in their appearances and disappearances, their movements and associations; (3) physical and meteorological phenomena; (4) geographic features; (5) the plant kingdom; (6) the animal kingdom; (7) human beings in every possible state and activity, whether individually or collectively as a community; (8) the spirit world in association with man.

Those among whom the lore is to be found may be a tribe, a race or people, inhabitants of a region, a social class, or people representing a calling in life. Any or all of these themes of lore existing in any human group may be investigated in accordance with the folklore society's scheme, which takes in serious and seemingly trivial topics alike. The folklorist by his researches may advance our general knowledge of folk industries, folk aesthetics, and folk sociology. Scientific investigations of myths and their origin, or the tracing of the

migrations of tales, have contributed information in respect to community of descent or with reference to interchange of ideas through geographical proximity or through emigration. These have their value to the ethnologist, or they show the anthropologist how similar conditions call forth similar phenomena, as in the matter of kindred nursery rhymes, or counting jingles, games, or customs, among totally unrelated peoples of the world.

A study which has yielded so much, and may yield such great results, deserves its recognition as a scientific branch of research, if pursued with proper equipment, thorough and correct method, and with judgment. In the earlier days the collectors naturally worked in the field as dilettanti, and there was a tendency to look upon the examples of myths, customs, superstitions, or belief, rather as curiosities than as telling some story of human civilization. There was too great an inclination to add to the attractiveness of the picture that was drawn by touching it up or giving it special color; there was a natural proneness to modernize the legend that was recorded, to introduce material, or make more up-to-date folk songs than were set down. One thing, above all, is now recognized as essential for the true folklorist: it is fidelity and scrupulous care in recording the matter, whatever it be, if he expects it to have any real scientific value. Special caution, moreover, and heed in drawing deductions are indispensable. For example, in accounting for folk thought and custom, especially the occurrence of the same phenomena in regions wide apart, among peoples of different race, or belonging to distinctly different types, the following cautions should be observed:

1. To be sure that the resemblance is actual and not superficial.
2. To keep in mind that sporadic resemblances may be purely accidental.
3. To remember that all mankind under similar environments has thoughts and ways in common, on the axiom that like causes produce like effects.
4. To recognize the fact that the more numerous the instances and the more complex the customs under consideration, the more certainly has there been acculturation of some kind; but caution must be observed in drawing deductions of blood relationship from similarities in sayings and arts.

Bibliography. The number of works, articles, or treatises on the various branches of folklore study is immense. For convenience simply, reference may be made to Gomme, *Handbook of Folklore* (London, 1887); id., *Ethnology in Folklore* (New York, 1892); Cox, *An Introduction to Folklore* (London, 1895). The best bibliographic lists may be obtained from consulting the *Journal of American Folklore*, published by the American Folklore Society (Boston and New York, 1888 et seq.); *Folklore*, being the transactions of the Folklore Society (London, 1890 et seq.); *Beiträge zur Volks- und Völkerkunde* (Berlin, 1893 et seq.); *Mélanges* (Paris, 1877 et seq.); *Biblioteca de las tradiciones españolas* (Madrid, 1881 et seq.); *Archivio per lo studio delle tradizioni popolari* (Palermo, 1881 et seq.); *Bulletin du Folklore* (Brussels, 1891); *Schweizerisches Archiv für Volkskunde* (Neuchâtel, 1897 et seq.). Consult also W. Carew Hazlitt, *Faiths and Folklore*; *Dictionary of National Beliefs* (a new edition of Brand's

treatise, New York, 1905), and Eisenstädter, *Elementargedanke und Uebertragungstheorie in der Völkerkunde* (Stuttgart, 1912). See also DEMONOLGY; FOLK MUSIC; MAN, SCIENCE OF; MORTUARY CUSTOMS.

FOLKMOOT. See FOLCMOT.

FOLK MUSIC. Music which is the outgrowth of a people's development, as opposed to *art music*, which owes its existence to the characteristic compositions of a few individuals. National music, however, may be, and generally is, based on the folk music of the country. Folk tunes are the wild flowers in the realm of music. They are valued to-day more highly than ever, both for their intrinsic beauty and as themes for composers with nationalistic tendencies. By way of supplementing the earlier collections of songs and dances made by private individuals, the governments of several European countries have in recent times borne the expense of gathering and printing whatever could be found of this indigenous folk music, while the inventive faculty of composers has been frequently rejuvenated, during the last eight centuries, at this inexhaustible fount of original melody. This is particularly noticeable in the case of Hungarian folk music, which has provided material not only for native composers, but also for Germans, especially those who made their home in Vienna. Haydn made good use of folk music, and in more recent times Liszt collected a great number of the Magyar melodies as played by the Gypsies, and used them as the themes for his Hungarian rhapsodies. Even Schubert, the most spontaneous of all melodists, was so struck by the charm of the Magyar melodies that he copied some of them and embodied them in his works. Brahms and others did the same thing. In Russia, Poland, Bohemia, and Scandinavia, Tschaiakowsky, Chopin, Dvořák, Grieg, and many others adopted the melody of the people or fashioned their own in its image. Beethoven went to Scotland and Ireland for the melodies of some of his songs and to Russia for the themes of some of his chamber compositions. Nor have Oriental countries been ignored. Puccini traveled as far as Japan in one of his operas. Edgar Kelley wrote a Chinese suite, and Edward MacDowell an Indian suite based on aboriginal American melodies.

The lower the composer descends in the scale of civilization, the more refractory his borrowed material is apt to prove. While primitive music—the music of uncivilized peoples—also comes under the head of folk music, in the widest sense of the word, it is too different in character and too wide in scope to be treated of under this head. One misconception regarding it may, however, be corrected here. It is not true, as commonly assumed, that the vocal music of the lower races is always associated with words. The songs of savages are frequently songs without words or with words that have no meaning. But when we come to mediæval European folk song, we find that what Wagner wrote concerning it is true: "The word poem and the tone poem are one and the same thing. The people never think of singing their songs without words. . . . The two seem to belong together, like husband and wife." Owing to this close adaptation of the music to the words, the mediæval folk music is indeed more artistic than the art music of the ecclesiastical composers of the same period, who usually maltreated their words or buried them under a rank growth of contrapuntal

artifices. Nor is this the only point of superiority. While the ecclesiastical composers were still hampered by the unwieldy church modes, folk music had instinctively adopted the modern major and minor modes and thus represented in its day the music of the future. Furthermore, it had much greater rhythmic variety, as well as more melodic originality and charm, so that it is not surprising that the church composers began, as early as the twelfth century, to adopt folk tunes as themes for their masses and motets. Too often they distorted them almost past recognition; but in the sixteenth century Luther had the courage to discard the monotonous Gregorian chants and substitute for them in church good folk songs, unaltered except as to the words. It is not difficult to understand why folk songs should have been, as a rule, more spontaneous than the art music of these early times. The church composers were hampered by artificial rules, and there were only a limited number of them, whereas the folk singers were countless in number and could do as they pleased. The assertion made in musical histories, that the folk songs of Europe were invented by the Troubadours (q.v.) and Minnesingers (q.v.) and from them passed to the people, is contrary to the facts. It was the Troubadours and Minnesingers who got many of their tunes from the people, and among the people they were a matter of slow growth. Few, perhaps, were the product of one mind. A man might spontaneously conceive a melody to give expression to his feelings of love or religious fervor or some other joyous or sad emotion; others would repeat it, with additions and improvements, until finally a perfect melody would be evolved—a melody that spoke to the hearts of all. Usually folk songs were sung as melodies only; in some cases harmonic parts were added.

Of all European countries, Germany probably has the greatest number and variety of good folk songs. Many collections of them have been printed, a list of which may be found in Engel's *The Literature of National Music* (London, 1879), a valuable guide for the student of this subject. As folk music is anonymous and not copyrighted, and as it frequently undergoes slight changes, it is not surprising that few of the old German tunes have come down to us unaltered. They were affected by contact with art music, which gradually wore off their rough edges and polished them; and since Germany has set the standard in modern music, it is easy to understand why its folk songs should for these reasons seem normal to us—i.e., deficient in those exotic traits which characterize the popular music of such countries as Russia, Scandinavia, and Hungary. Italy and France are in this matter in the same position as is Germany, because they, too, have helped to fix the modern musical standard. That does not make their folk songs any less admirable, but it prevents them from exercising so striking an influence on the art music of our time. Italy, the "land of song," has, strange to say, contributed little of great value to the world's stock of authentic folk music. There were, of course, in the olden times, plenty of *ballate*, *villanelle*, *frottole*, and other kinds of folk music; nor is there a lack of collections of what purport to be Italian folk songs, Neapolitan, Sicilian, Venetian, and so on; but in most cases it is impossible to tell whether these melodies were really invented by the people in true folk-music fashion, or whether they were

taken from the thousands of operatic scores which have practically monopolized the musical interest of the Italians ever since the beginning of the seventeenth century. The best songs in Petrucci's collection, published in 1503, are taken from German, French, and other sources, and there is reason for the assertion made by Mrs. Wodehouse that "Italian musicians held the popular songs of other countries in higher estimation than their own." So far as Italian songs have harmonic accompaniments, they are apt to be simple and commonplace, avoiding modulation; and the songs are more interesting melodically than rhythmically.

In French folk music, also, no great attention is paid to harmony or accompaniment, but rhythmic variety and piquancy constitute a striking trait, and the words are apt to govern the tune, instead of vice versa, as in Italy. Among the French *airs*, *chansons*, *chants*, and *romances* there is plentiful variety of subject; many are witty, and political songs are popular. There are also *brunettes*, addressed to young girls, and other tender songs; but French folk music seldom is so soulful and romantic in its yearnings as the German, or so poignant in the expression of grief as the Russian or Scandinavian. In the neighboring country of Spain folk music has much more of an exotic character than in France, Italy, or Germany; nor is this surprising, since in that country, especially in Andalusia, the Moorish influence makes itself strongly felt. This is shown in the predominant use of song as an accompaniment to dancing, in quaintly Oriental melodic intervals, in the abundance of ornaments, and in the simultaneous use of several rhythms. But whether Oriental or purely Spanish, there is an ineffable charm in the national music of the Spanish people—the *jotas*, *boleros*, *fandangos*, *seguidillas*, *malaqueñas*, etc. Bizet caught some of the charm of this music in his *Carmen*; and some day, if Spain ever gives birth to a Liszt, a Dvořák, or a Grieg, marvels of novel musical beauty may be expected.

While England has long been reputed an unmusical country—chiefly for the reason that, like Spain, it has never produced a composer of the first rank—there was a time when the people of that country were as musical as those of any other part of Europe, so far, at least, as the enjoyment and practice of music are concerned. There were always bards and minstrels, who were richly rewarded for their services, and in the dim past every man was apparently expected to be able to sing and accompany himself on the harp. What is most surprising about English music, both popular and professional, is that there is so little about it that is characteristically national. This is particularly true regarding instrumental music (of which all continental nations have such abundant variety) and folk song. It is only in concerted vocal music, the madrigal, and the glee, that we find a national flavor. The ballad is, indeed, also very much favored in England; the *Beggar's Opera*, with its 69 popular ballads and dance tunes, struck the keynote of English taste; yet in most instances the words of the English ballads have infinitely more merit and national character than the music. In Wales, Ireland, and Scotland, on the other hand, the popular music not only has a strong national flavor, but it is almost as exotic as that of the border lands of the European continent. The charms of Irish folk melo-

dies have been made known to thousands by the association of a number of them with Moore's poems, and in more recent times through the collection made by Villiers Stanford, who also wrote an opera, *Shamus O'Brien*, full of quaint musical Hibernicisms.

Of Scotland's folk music there are almost as many collections as of Germany's, and they include many gems of the first water. The bagpipe is typical of Scottish folk music; it is not, as many suppose, an instrument on a level with the barrel organ, but has a great fascination for educated musicians, with its persistent drone and queer melodic intervals. Scottish music has a characteristic which it shares with the Chinese—the pentatonic (or five-tone) scale which omits the fourth and seventh tones of the ordinary diatonic scale; it can be amusingly imitated by playing only on the black keys of a piano. Scottish music also has a good deal in common with the folk music of Scandinavia, especially Norway. The Norwegian, Grieg, was partly of Scottish descent, and so is his music. Grieg did not, as so many writers have erroneously stated, habitually incorporate Norwegian folk melodies in his compositions. What he did was to write in the style and spirit of Norwegian folk music. This music shares the rugged, gloomy characteristics of Norwegian scenery and climate; it indulges in frequent capricious changes of rhythm and tempo, occasioned by the close alliance between the words and music; it evinces a preference for the minor mode; its tonality is often uncertain; and its melodic intervals are strange to our ears.

Similar traits are noted in the national melodies of Russia, which, according to Rubinstein, are equaled in charm only by those of Sweden and Norway, while César Cui claims for Russia supremacy over all countries. The typical Russian folk song is of limited compass, and this is probably attributable to the primitive instruments of the lute and violin families long in use. The prevailing mood of these songs is melancholy, but some of them are characterized by a wanton excess of animal spirits. Florid passages on one syllable occur, and the harmonies are apt to be bold and harsh. Liszt's ultra-modern discords had no terrors for the Russian composers brought up on such food. Bohemian music is remarkable for its varied rhythms and great diversity of dances. Polish folk music is chiefly instrumental; its general traits are well known, owing to the wide diffusion of the works of Chopin, in which (especially the mazurkas) they are admirably reflected. The *tempo rubato*, or capricious and frequent change of time, is also an essential trait of Hungarian music, although its use in the mazurka differs widely from its application to the Gypsy *csárdás* (q.v.). Hungarian music has a scale of its own, with an augmented fourth that intensifies its melancholy. It is usually highly ornamented, and these ornaments were supplied by the Gypsies, while the melodies themselves are of Magyar origin. All these things go back to a remote antiquity. Folk music is never the growth of a few centuries; it requires ages and isolation, and this is why the New World, cosmopolitan America, has none.

Bibliography. The best series of articles on folk music are those by Krehbiel which appeared in the New York *Sunday Tribune* for July, August, September, and October, 1899. Consult also: Finck, *Songs and Song Writers* (New York, 1900); Parry, *The Evolution of the Art*

of Music (ib., 1896); Wallaschek, *Primitive Music* (ib., 1893); Engel, *An Introduction to the Study of National Music* (London, 1886); Leland and Prince, *Popular Songs of the Algonquians* (New York, 1902); K. Breuer, *Das deutsche Volkslied* (Paderborn, 1908); R. Williams, *Folk-Songs of England* (London, 1908); A. Millien, *Chants et chansons recueillis* (Paris, 1908); E. Lineff, *The Peasant Songs of Great Russia* (St. Petersburg, 1908); H. Thuren, *Folk-sangen* (Copenhagen, 1908, Danish and German); J. Meier, *Kunstlied und Volkslied in Deutschland* (Halle, 1906); G. Bantock, *One Hundred Folksongs of All Nations* (Boston, 1911); R. R. Whitehead, *Folksongs of Eastern Europe* (New York, 1912); J. L. Cahan, *Yiddish Folksongs* (2 vols., ib., 1912); H. E. Krehbiel, *Afro-American Folksongs* (ib., 1914).

FOLK PSYCHOLOGY. A science intimately related to psychology, sociology, and ethnology, dealing with the psychological phenomena due to man's gregarious mode of life. Folk psychology might thus logically coincide with sociology, but, as a matter of historical development, the existing science of sociology deals mainly with the social phenomena of the more advanced cultures, while folk psychology includes those of relatively primitive tribes as well. For the converse reason it is more inclusive than the science of ethnology in its present state, while, on the other hand, it does not deal at all with the purely historical problems that occupy the ethnologist's attention. Finally, folk psychology differs from psychology in analyzing the psychological manifestations, not of individuals, but of social groups. In practice, to be sure, these several sciences are not antagonistic, but mutually complementary. For example, the psychology of the individual is frequently intelligible only through a consideration of folk-psychological motives. Thus, most of the earlier and often ingenious speculations as to the origin of religion are worthless because they assume a direct reaction of the individual to the surrounding universe in which he finds himself. Folk psychology insists that religion is a social phenomenon, and that the individual's religious reactions are very largely determined by the preëxisting religious concepts of his social group. Wundt recognizes three subjects of inquiry that are peculiarly amenable to folk-psychological treatment—language, religion, and custom—for no one of them is conceivable except as due to the interaction of distinct individuals. Consult: *L'Année sociologique*, ed. by Durkheim (Paris, 1896-); *Zeitschrift für Völkerpsychologie und Sprachgeschichte*, ed. by Lazarus und Steinthal (20 vols., Berlin, 1860-90); Lévy-Bruhl, *Les fonctions mentales des sociétés inférieures* (Paris, 1910); Wundt, *Völkerpsychologie* (Leipzig, 1900); id., *Elemente der Völkerpsychologie* (ib., 1912).

FOLK-RIGHT. The body of customs recognized as having the force of law in early English history. As used by the Norman kings, the expression has reference to the native law and custom, as distinguished from the rules and observances introduced by the Conqueror and his followers. Later, the term is synonymous with the expression "common law," by which it was soon superseded. Consult the authorities referred to under **ANGLO-SAXON LAW**.

FOLKS, fòks, HOMER (1867-). An American sociologist, born in Hanover, Mich. He was educated at Albion College (Michigan)

and at Harvard, where he graduated in 1890. From 1890 to 1893 he was secretary of the Children's Aid Society of Pennsylvania and from 1893 to 1902 secretary of the New York State Charities Aid Association. He was elected to the New York City Board of Aldermen as an anti-Tammany member in 1897 and 1898, and was an unsuccessful candidate for the State Assembly in 1899. In the spring of 1900 he went to Cuba to assist the United States military authorities in reorganizing the public charities of the island; in 1902-03 he was Commissioner of Charities for New York City. He was president of the New York State Probation Commission after 1907, and in 1911 president of the National Conference of Charities and Correction, in which he had been prominent for many years. His literary work includes the editing of the *Charities Review*, numerous reports and magazine articles, *The Care of Destitute, Neglected, and Delinquent Children* (1902), and *Problems in the Administration of Municipal Charities* (1904).

FOLLEN, AUGUST, afterward ADOLF LUDWIG (1794-1855). A German poet and patriot. He was born in Giessen, Jan. 21, 1794. He was imprisoned (1819-21) for political agitation in Berlin and after his release spent his life in Switzerland. He died in Bern, Dec. 26, 1855. He is known for his anthology of German poetry, *Bildersaal deutscher Dichtung* (1827), but also for *Das Nibelungenlied im Tone unserer Volkslieder*, I. Teil, Siegfrieds Tod (1843) and *Tristans Eltern*, a romantic epic in 20 cantos, for a collection of *Latin Hymns* (1819), and for translations of the *Homeric Hymns* (1814) and Tasso's *Jerusalem Delivered* (1819). His chivalrous romances, e.g., *Malegys und Vivian* (1829), and his poems, with few exceptions, are not important. He deserves much credit for helping Gottfried Keller at the beginning of the latter's career.

FOLLEN, CHARLES THEODORE CHRISTIAN (1795-1840). A German clergyman, scholar, and reformer, brother of the preceding. He was born at Romrod in Hesse-Darmstadt and studied theology at Giessen, where he showed himself an ardent believer in the principles of the French Revolution. After some weeks of soldiering against Napoleon in 1814, he returned to his studies and in 1818 received an appointment as university lecturer in law. His revolutionary views, however, expressed in radical songs and inflammatory addresses, drove him from Giessen to Jena and thence to France, to Coire in Switzerland, to Basel, where he was appointed lecturer at the university, and finally, in 1824, to America. In 1825 he was appointed a teacher of German at Harvard College and three years later became teacher of ecclesiastical history and ethics in the divinity school. From 1830 to 1835 he was professor of German literature at Harvard. He was dropped from the Harvard faculty in 1835 because of his abolitionist sentiments. Later on he preached in the First Unitarian Church of New York City and in 1839 accepted a call to the pastorate of a church of the same denomination in Lexington, Mass. From the commencement of the antislavery movement he was an avowed Abolitionist and a warm friend and associate of Garrison. He lost his life in the burning of the steamboat *Lewington* on Long Island Sound, Jan. 13, 1840. His works, with a *Memoir*, were published at Boston in 1841.

FOLLEN, ELIZA LEE (CABOT) (1787-1860). An American author, born in Boston, Mass., a friend of William Ellery Channing, and a staunch Abolitionist. Her writings were at one time very popular and include, besides a *Memoir* (1842) of her husband, Prof. Charles Theodore Follen, *Well-Spent Hours* (1827); *Poems on Occasional Topics* (1839); *To Mothers in the Free States* (1855); *Anti-Slavery Hymns and Songs* (1855).

FOLLETT, SIR WILLIAM WEBB (1798-1845). An English lawyer and politician, born at Topham, near Exeter. After studying at Trinity College, Cambridge, and at the Inner Temple, he commenced practice as a pleader in 1821 and was called to the bar in 1824, where his success was immediate and his progress rapid. In 1835 he was returned to Parliament for Exeter and soon gained distinction. Under Sir Robert Peel (1834 and 1841) he served as Solicitor-General. In 1835 he was knighted and in 1844 succeeded Sir Frederick Pollock as Attorney-General, but, his health having failed, he was forced to give up practice. As an advocate, he was lucid and persuasive, though never eloquent. A statue of him by Behnes is in Westminster Abbey.

FOLLEVILLE, fôl'vêl, GABRIEL GUYOT DE (1760-94). A French priest, who took an important part in the Revolution. He was born in Brittany and studied law, but on the outbreak of the Revolution decided to enter the Church. He became curate of Dol in the spring of 1790; in 1791 he retracted his oath to the civil constitution and was forced to flee to Paris by his disgusted parishioners. But after the Tenth of August he left Paris, went to Poitiers, and there began his remarkable career of deceit. Going to the convent of the Filles de la Sagesse, he announced himself as a papal delegate and Bishop of Agra and became one of the leading Jacobins of the town. In 1793 the "Bishop of Agra" was made the head of the ecclesiastical council of Saint-Laurent-Sur-Sèvre, then of the administrative and judicial councils of another department. Abbé Bernier, of Saint-Laud, jealous of Folleville, made inquiries in Rome about him and learned that there was no Bishop of Agra. After the defeat of Le Mans he was captured, taken to Angers, recognized, tried, and guillotined. Consult Chassin, *La préparation de la guerre de Vendée* (1892) and Bossard, *L'invention de l'évêque d'Agra* (1893).

FOLLICLE (Lat. *folliculus*, dim. of *foliis*, bag; probably connected ultimately with OHG. *ballo*, Ger. *Ball*, Icel. *ballr*, Eng. *ball*). A dry fruit or pod, composed of a single carpel, and opening by splitting down one side, as that of the peony. See **FRUIT**.

FOLLIS. See **BALL**.

FOLQUET DE MARSEILLE, fôl'kâ' de mâr-sâ'y' (1155-1231). A Provençal poet and troubadour. He was born in Marseilles of wealthy parents, but chose the roving life of a minstrel, traveled from court to castle, reciting his verses, making love to noble ladies, and composing in their honor poems which evidenced genuine feeling. When nearly 40 years old he experienced a change of heart, entered the Church, and by 1203 was Bishop of Toulouse and a strenuous persecutor of heretics. Because of the asceticism of his later years the looseness of his early life was so far overlooked that Dante awarded him a place in *Paradiso* (canto ix). Thirty of his poems remain, but there is no modern edition of them.

FOL'SOM, CHARLES (1794-1872). An American scholar and editor, born at Exeter, N. H. He graduated in 1813 at Harvard, and in 1816 became a chaplain in the United States navy, and midshipmen's instructor in mathematics on board the *Washington*. In the latter capacity he had David G. Farragut as one of his pupils. From 1821 to 1826 he was at Harvard, as a tutor in 1821-23, as librarian in 1823-26, and also as instructor in Italian in 1825. He was subsequently a partner in the firm of Folsom, Wells & Thurston, printers, and superintended the publication of classical works for Harvard. In 1824 he was an editor of the *United States Literary Gazette* with W. C. Bryant, and in 1833 of the *Select Journal of Foreign Periodical Literature* with Andrews Norton. His publications were annotated editions of *Cicero's Select Orations* (1811) and of *Additional Selections from Livy* (1829).

FOLSOM, CHARLES FOLLEN (1842-1907). An American physician, born at Haverhill, Mass. He graduated at Harvard in 1862; from 1862 to 1865 was an instructor among the freedmen of the South; in 1870 graduated at the Harvard Medical School, and subsequently practiced medicine in Boston. In 1873-75 he studied at the universities of Vienna, Berlin, and Munich; from 1877 to 1885 was lecturer on hygiene at Harvard, and from 1879 to 1882 lecturer in and assistant professor of mental diseases. In 1882 he became a member of the National Board of Health, Lunacy, and Charity. His writings include *Mental Diseases* and *The Present Aspect of the Sewage Question as Applied to Boston* (1877).

FOLSOM, GEORGE (1802-69). An American antiquary, born at Kennebunk, Me. He graduated in 1822 at Harvard, was subsequently admitted to the bar, and practiced law at Worcester, Mass. In 1837 he removed to New York City, in 1844 was elected to the New York State Senate, and from 1850 to 1854 was chargé d'affaires to Holland. He was a member of the New York Historical Society and at one time president of the American Ethnological Society. He published *Sketches of Saco and Biddeford* (1830); *Dutch Annals of New York* (1841); *Mexico in 1842* (1842); *Letters and Dispatches of Cortez* (1843); *Documents Relating to the Early History of Maine* (1858).

FOLSOM, NATHANIEL (1726-90). An American Revolutionary soldier and legislator, born in Exeter, N. H. He commanded a company of New Hampshire militia in the French and Indian War, served under Sir William Johnson at Fort Edward, and participated in the defeat and capture of Baron Dieskau in 1755. At the outbreak of the Revolution he was commissioned a brigadier general of New Hampshire volunteers, served at the siege of Boston, and was promoted a major general by the Council of New Hampshire and served as such throughout the war. He was a delegate from New Hampshire to the Continental Congress in 1774 and again in 1777 and 1778-80. In 1783 he was president of the New Hampshire Constitutional Convention.

FOLSOM CITY. A city in Sacramento Co., Cal., 22 miles by rail northeast of Sacramento, on the Southern Pacific Railroad, and on the American River (Map: California, D 4). The city enjoyed great prosperity in the early gold-mining days of California, and one of the State prisons is now situated near here. The

chief industries are gold dredging, fruit and stock raising, dairying, and the manufacture of crushed-rock products. Pop., 1914 (local est.), 1500.

FOLTZ, föltz, PHILIPP (1805-77). A German historical painter, born at Bingen. He was the pupil of his father, Ludwig Foltz, and studied at Munich under Cornelius, whom he assisted with the frescoes in the Glyptothek. Afterward he decorated the Schiller Salon in the new Royal Palace. He became professor and later (1870) director of the Academy of Munich. Among his latest works were two large paintings for the Maximilianeum: "Frederick Barbarossa and Henry the Lion," and "Pericles Attacked by Cleon." His pictures include two large hunting scenes for Maximilian II; "The Singer's Curse" (Munich Pinakothek); "Götz von Berlichingen" (Vienna Gallery); and "King Otho Leaving Munich for Greece," a fine cartoon. His pictures are good in composition and careful in execution, but conventional in form and dry in color.

FOLWELL, WILLIAM WATTS (1833-). An American educator, born at Romulus, Seneca Co., N. Y. He graduated in 1857 at Hobart College, where, two years later, he was appointed adjunct professor of mathematics. In 1860-61 he studied philology at the University of Berlin. When he returned to the United States he enlisted in the Fiftieth New York Volunteers (engineers) and attained the brevet rank of lieutenant colonel. Subsequently he was professor of mathematics at Kenyon College (1869), president of the University of Minnesota (1869-84), and professor of political economy at the latter institution (1871-1907). His publications include *Public Instruction in Minnesota* (1875), and *University Addresses* (1909).

FOLZ, föltz, HANS (c.1478-c.1515). One of the famous Meistersingers. He is said to have been born at Worms, Germany, and spent the greater part of his life in Nuremberg, where he worked as a barber-surgeon. His serious songs are spirited and moral in tone, but his *Fastnachtspiele* (farces) are quite the reverse.

FOMENTATION (from Lat. *fomentatio*, from *fomentare*, to foment, from *fomentum*, fomentation, from *fovere*, to keep warm). An application of warmth and moisture to a part by means of cloths wrung out of hot water, sometimes medicated infusions of vegetable substances, calculated to relieve pain or stimulate the surface. Thus, opium, belladonna, chamomile, turpentine, etc., are used in various forms in connection with fomentations, which are of very great service in the treatment of several painful local disorders.

FONBLANQUE, fön-blänk', ALBANY (1793-1872). An English journalist. He was born in London in 1793 and first studied for the bar, but afterward drifted into journalism. As leader writer (1826-30) and as editor (1830-47) of the *Examiner*, the leading Liberal weekly journal of the time, Fonblanque exhibited a singular keenness of both wit and intellect and exercised great influence. In 1837 he republished in book form a selection from his leading articles, under the title *England under Seven Administrations*. In 1847 he relinquished the editorship of the *Examiner* and entered the statistical department of the Board of Trade. Consult *The Life and Labors of Albany Fonblanque* (London, 1874), a collection of articles edited by Fonblanque's nephew, E. B. de Fon-

blanque, and preceded by a biographical introduction from the pen of the latter.

FONCIN, fön'sän', PIERRE FRANÇOIS CHARLES (1841-). A French geographer and educator, born at Limoges. He studied at the Ecole Normale de Paris, and in 1876 became professor of geography in the faculty of letters at Bordeaux. In 1879 he was appointed director of the Douai Academy, in 1881 director of secondary education in the Ministry of Public Instruction, and in 1882 inspector general of secondary education. He was a founder of the *Alliance Française*, of which he became successively general secretary and president. His publications include: *Textes et récits d'histoire de France* (1872), for use in primary schools; *La première année de géographie* (1874); *Géographie générale* (1887); *Le pays de France* (new ed., 1902); *France*, trans. by H. H. Kane (1902).

FONDA. A village and the county seat of Montgomery Co., N. Y., 27 miles west-northwest of Schenectady, on the Mohawk River, the State Barge Canal, and on the New York Central and Hudson River and the Fonda, Johnstown, and Gloversville railroads (Map: New York, F 5). Fonda contains a public bathhouse with mineral water, and an industrial school for girls. It is the centre of an agricultural region, containing large ginseng gardens. There are knitting and flouring mills, a broom factory, silk mills, machine shop, bottling works, etc. The water works are owned by the village. Pop., 1900, 1145; 1910, 1100.

FOND DU LAC, fön' du läk' (Fr., further end of the lake; so called from the situation of the city). A city and the county seat of Fond du Lac Co., Wis., 58 miles north by west of Milwaukee, on Lake Winnebago, at the mouth of the Fond du Lac River, and on the Chicago and North-Western, the Minneapolis, St. Paul, and Sault Ste. Marie, and the Chicago, Milwaukee, and St. Paul railroads (Map: Wisconsin, E 5). Through Lake Winnebago and Fox River there is communication by water with the Great Lakes. The city is picturesquely situated and has the Grafton Hall School for Girls (Protestant Episcopal), St. Agnes Hospital and Sanatorium, St. Mary's Springs Academy (Catholic), State women's reformatory, a public library, and Lakeside and Taylor parks. The leading manufactures are leather, lumber, refrigerators, typewriters, mill machinery, furniture, caskets, saw-mill machinery, candy, drugs, and butter and cheese. Fond du Lac was settled in 1836 and was incorporated as a village in 1847 and chartered as a city in 1852. It adopted the commission form of government in 1914. Pop., 1900, 15,110; 1910, 18,797; 1914 (U. S. est.), 20,367.

FONDI, fön'dé. The ancient Fundi, a town in south Italy, in the Province of Caserta, 7 miles from the sea and 87 miles southeast of Rome on the ancient Appian Way (Map: Italy, D 4). The ruins of the castle, which in the sixteenth century belonged to the Colonnas, and town walls testify to its former splendor. In the Gothic church of Santa Maria there are some eleventh-century mosaics. Thomas Aquinas once taught in the chapel of the Dominican monastery. Fondi was burned by the Saracens in 846, laid waste in 1534 by the pirate Khair-ed-Din (Barbarossa), as the church records show, and again destroyed in 1594 by the Turks. Fondi marks the northernmost point in Italy where the extensive growth of oranges and lemons is

now carried on. The wine of Fondi is praised in the writings of Horace and Martial. Lago di Fondi, the lake in the valley near the town, was known in classical times as Lacus Amyclanus. Pop. (commune), 1901, 9930; 1911, 11,378.

FONNI, fōn'ně. The highest town in Sardinia, located 21 miles south of Nuoro in the province of Sassari. At a little to the north of the town are located the remains of the ancient Roman Station Sarabale, mentioned in the *Antonine Itinerary* as being 87 miles from Carales on the way to Olbia. The buildings were grouped around a courtyard about 100 feet square. In the neighborhood of Fonnì are the remains of stone age monuments known as *menhirs* and *nuraghs*. Pop., 1911, 4315.

FONSAGRADA, fōn'sā-grā'nā. A town in the Province of Lugo, Spain, about 25 miles east by north of Lugo (Map: Spain, B 1). It is situated in a mountainous region, with fertile valleys, and is engaged principally in stock raising, dairying, and agriculture. There are some manufactures. Pop., 1900, 17,448; 1910, 19,219.

FONS EBRALDI. See FONTEVRAULT.

FONSECA, fōn-sē'kă, ANTONIO MANOEL DA (1796-1893). A Portuguese historical and portrait painter. Born at Lisbon, he studied at the Academy of that city under Sousa Loureiro, afterward became a professor in the Academy, and in 1830 was appointed court painter. In 1852 he was elected a corresponding member of the Academy of Fine Arts at Paris. Many of his works were exhibited at the Paris exhibitions of 1855 and 1867. They include chiefly historical scenes, such as "The Death of Albuquerque," "Christ in the Midst of the Doctors," "Christ Driving the Money-Changers from the Temple," and portraits of the Portuguese Kings, including Ferdinand and Pedro V.

FONSECA, GULF OF; also known as the Gulf of Amapala (called *Chorotega* by the American Indians). An inlet of the Pacific ocean, situated in a volcanic region between the three Central American states of Salvador, Honduras, and Nicaragua (Map: Central America, D 4). It is nearly 20 miles long and over 40 miles wide, containing a number of islands, and receives the waters of numerous rivers.

FONSECA, JUAN RODRÍGUEZ DE. See RODRÍGUEZ DE FONSECA, JUAN.

FONSECA, MANOEL DEODORO DA (1827-92). The first President of the Republic of Brazil. He was born at Alagoas, Brazil, was educated at the military school at Rio de Janeiro, and was commissioned a lieutenant of artillery in 1849. He took a prominent part in the war with Paraguay in 1868-70 and was promoted to the rank of division general. About 1881 he became imbued with republican ideas and organized the Military Club at Rio de Janeiro. Fonseca's activity and pronounced republicanism, although he was a warm personal friend of the Emperor, Dom Pedro, finally led in 1887 to his appointment as Governor of a frontier province, in order to remove him from the capital, where his influence was thought to be dangerous. Having returned to Rio de Janeiro in 1889, he entered actively into the schemes of the Republicans in army circles and in the newly established Republican League, which culminated, on November 15 of that year, in the dethronement of Dom Pedro and the establishment of the Republic of Brazil. Fonseca was chosen head of the pro-

visional government. The new constitution was proclaimed on Feb. 24, 1891, and on the same day Fonseca was elected to a four years' term as the first President of the Republic. He became almost immediately involved in conflicts with the national Congress, which increased in bitterness until he finally, on Nov. 3, 1891, dissolved Congress and proclaimed himself Dictator, placing the capital under martial law. The navy, remaining faithful to the Constitutional party, turned the tide against him, and on November 23 the army also declared against him, and, finding himself deserted, he resigned and took no further part in public affairs.

FONSECA, PEDRO DA (1528-99). A Portuguese philosopher and theologian of the Jesuit Order, often called the *Portuguese Aristotle*. He was born at Cortizada and was educated at the Jesuit chapter house at Coimbra and at the University of Evora, whence he returned to Coimbra as professor of philosophy. He rose high in his order, was Portuguese Minister in the reign of Philip II, and was charged with several important missions by Gregory XIII. In letters he is best known for his studies of Aristotle—*Institutiones Dialecticæ* (1564), *In Libros Metaphysicorum Aristotelis* (1577), and *Isagoge Philosophica* (1591). In dogma he made himself a name by his stress on God's prevision, and the attempt, further carried out by Molina, his pupil, to obviate the apparent clash between predestination and free will.

FONSECA BENEVIDES, bā'nā-vé'dáz, FRANCISCO DA (1835-). A Portuguese scientist and author. He was born at Lisbon, the son of a physician, and studied medicine. He entered the navy in 1851, at the age of 19 became professor of physics in the industrial school at Lisbon, and a year later (1855) entered the faculty of the Naval Academy. He was made a member of the Lisbon Academy in 1866 and was sent by the government to various national exhibitions, and he exhibited some of his scientific apparatus at Paris in 1878. In 1884 he was made inspector of the Portuguese industrial schools. He founded the Lisbon Industrial Museum. Besides his contributions to Portuguese technical journals, he wrote: *Curso de artilheria* (1850); *Curso de physica* (1863); *Relatório sobre a exposição de Paris em 1867* (1867); *Princípios de optica* (1868); *O Fogo* (1869); *Noções de physica moderna* (2d ed., 1880); *Elementos de balística* (2d ed., 1882); *Mémoire sur la vitesse de propagation des flammes* (1880); and the historical work, *As rainhas de Portugal* (2 vols., 1878-79)—all published in Lisbon. Consult I. F. da Silva, *Diccionario bibliographico portuguez*, vol. ix (Lisbon, 1870).

FONSECA LIMA E SILVA, lê'mă á sêl'vá, MANOEL DA (1793-1862). A Brazilian soldier and politician, born at Rio de Janeiro. He entered the army, joined the movement for independence, and was commissioned lieutenant colonel and appointed Lord Chamberlain to the Emperor Pedro I. In 1828 he was promoted to the rank of brigadier. A man of Liberal ideas, he took part in the movement which forced the abdication of Pedro I and was appointed Minister of War in 1831 and again in 1835. He was Acting Minister of the Navy in 1835-36, and Minister of the Interior in 1836-37. In 1844 he was elected President of the State of São Paulo and, in 1847 to the National Senate. In 1851 he was made lieutenant general, performing special services in connection with the army,

FONS SANA. See FOSSANO.

FONT (Lat. *fons*, fountain; probably connected ultimately with *fundere*, Gk. *χεω*, *chein*, Goth. *giutan*, AS. *geotan*, OHG. *giozan*, Ger. *giessen*, Skt. *hu*, to pour). The vessel used in churches as the repository of the baptismal water. In the early Christian period, while immersion continued to be the ordinary form of the administration of the sacrament of baptism, the baptistery (q.v.), or other place set apart for the ceremony, was furnished with a basin sufficiently capacious to admit of the administration of the rite. But when it became customary to baptize by pouring the water on the head of the person to be baptized, the size of the basin was naturally diminished, and eventually it assumed the dimensions and the form which are now familiar to us in most of the mediæval churches in Great Britain and upon the Continent, thus doing away with the necessity for a separate building to contain it.

The earliest traditional example of a baptismal font is the great porphyry basin in the baptistery of Constantine in Rome, supposed since the early Middle Ages to have been that in which the Emperor was baptized. The baptismal font in its original form, as found in early baptisteries from the fourth to the tenth century, consists of a large basin, usually of octagonal form, with three steps, set below the pavement of the building, like the piscina of the Roman baths, and surrounded by a high veil (see BAPTISTERY.) During the Romanesque period a radical change took place. The basin was raised above the floor level and instead of being built up was usually hollowed out of a single block of marble, the exterior surface, between 3 and 4 feet high, being carved with appropriate religious subjects in relief. The North European schools were famous for their large bronze fonts, preëminent among which are those of Lambert Patras for St. Bartholomew at Liège and for the cathedral of Merseburg. Such fonts averaged from 8 to 12 feet in diameter. The fonts for baptism by affusion are smaller basins, raised on a base. They are of varying form: square, octagonal, cylindrical, hexagonal, the interior bowl being always round and seldom exceeding 2 feet in diameter. The bowl was supported usually by a heavy cylindrical shaft, often flanked by four or more minor shafts, sometimes by a square pier. As the Gothic period advanced, fonts became of decreasing importance and size and of simpler decoration.

In the Roman Catholic church the preparation and consecration of the water to be used in baptism constitute an imposing ceremonial. With a view to the preservation of the water thus consecrated, the font, especially when it is of porous stone, is sometimes lined with lead; and from an early date it is furnished with a lid, often of a highly ornamental character and secured by a lock. Among notable Renaissance fonts one of the most beautiful is in the baptistery under the cathedral of Siena. The ordinary place of the font is at the western end of the nave, near the entrance of the church, but in many cases it stands in a separate chapel, or a baptistery, or at least in a compartment screened off for the purpose. Even when it stands in the open nave it is properly inclosed by a rail. See BAPTISM; BAPTISTERY. Consult: Paley, *Illustrations of Baptismal Fonts* (London, 1844); Simpson, *Series of Ancient Baptismal Fonts* (ib., 1828); Corblet, *Histoire du sac-*

rement du baptême (Paris, 1882); Bond, *Fonts and Font Covers* (London, 1908).

FONTAINE, fôn'tân', CHARLES (1513-89). A French poet. He was born in Paris, but lived in Lyons for the greater part of his life. Devoted to poetry from his boyhood, his first published work of any importance was *Le Quintil Horatien* (1551), wherein with conservative enthusiasm he opposed the more advanced school of poets forming the "Pléiade." His other published works are: *Les ruisseaux de Fontaine* (1555); a translation of *Vingt et une épîtres d'Ovide* (2 vols., 1556); *Les dictes des sept sages* (1557); *Odes, énigmes et épigrammes* (1557).

FONTAINE, JEAN DE LA. See LA FONTAINE, JEAN DE.

FONTAINE, PIERRE FRANÇOIS LÉONARD (1762-1853). A French architect. When young, he went to Rome, where his connection with Percier (q.v.) began, which lasted for many years. Under Napoleon they restored the Imperial châteaux and palaces (Saint-Cloud, Versailles, Compiègne, Louvre, Tuileries) and built the Carrousel Arch of Triumph. The partnership having been dissolved on the fall of Napoleon, Fontaine remained court architect under Louis XVIII, Charles X, and Louis Philippe. He laid out the Rue de Rivoli, built the Chapelle Expiatoire, and enlarged the Palais Royal. He published a number of architectural books, with Percier and alone.

FONTAINEBLEAU, fôn'tân'blô'. A town of northern France, capital of an arrondissement in the Department of Seine-et-Marne, beautifully situated in the midst of an extensive forest, nearly 2 miles from the left bank of the Seine, 35 miles southeast of Paris (Map: France, N., H 4). The forest of Fontainebleau, bounded on the northeast by the windings of the Seine and covering an area of nearly 66 square miles, is renowned for its beauty and is regarded as one of the most picturesque parts of France. It was seriously damaged by fire in 1911. On the northwest edge of the forest is Barbizon, made famous by Millet, Corot, and Rousseau. In the town there are two hospitals, a library, a theatre, and monuments to President Carnot and Rosa Bonheur, the latter designed by the artist herself. Since 1875 the military academy for engineers and artillery officers has been stationed here. Grapes, famous for their fine quality, are cultivated; porcelain, lumber, gloves, and earthenware are manufactured. Pop. (commune), 1901, 14,160; 1911, 14,679. The President of the Republic frequently resides here during the summer months.

Fontainebleau is chiefly famous for its chateau, or pleasure palace, of the kings of France. It is said to have been originally founded by Robert the Pious towards the end of the tenth century. It was rebuilt in the twelfth century by Louis VII, of whom it was a favorite residence and hunting seat. It was enlarged by Louis IX and his successors.

The original castle was razed in 1527 by Francis I, who planned a pleasure palace less grim and more in harmony with the new life of the Renaissance. The plans were drawn up in 1528, probably by Gilles le Breton, who only partly carried them out in the Cour du Cheval Blanc, the Galerie de François I, the Galerie d'Henri II, and the peristyle of the Cour Ovale. The main portions were built shortly afterward by Pierre Chambige and Pierre Gérard. Under Henry II Philibert Delorme made additions, and

the famous Italian artists, such as Primaticcio, Rosso dei Rossi, and Serlio, were called to build and decorate. Their work here was so important as to give to this little group of artists the name of the school of Fontainebleau, whose influence spread widely over France. Royal favor of Henry II was withdrawn, to be revived under Henry IV, for whom were executed the new Galerie de Diane, the Place d'Armes, and the beautiful park about the palace. To Louis XIII considerable interior decoration was due. Under Louis XIV the palace was occupied by Madame de Montespan, but later the King deserted it for Versailles and Saint-Germain, making it his autumn residence. It was again transformed under Louis XV and occupied successively by Madame de Pompadour and Madame du Barry; under Louis XVI it was a favorite residence of Marie Antoinette. Napoleon I had the palace renovated at a cost of 12,000,000 francs, and Louis Philippe restored it in the style of the sixteenth century. The palace contains many famous paintings by Vien, Brenet, Barthélemy, Boucher, Vanloo, Le Brun, Blondel, Hallé, Cotellet, and Dubois, also a library of 30,000 volumes and a Chinese museum.

Notwithstanding the later modifications the palace of Fontainebleau remains, in both construction and decoration, one of the most superb works of the early and golden ages of the French Renaissance, with a tinge of special Italian influence. In the seventeenth century it was the residence of Christina of Sweden after her abdication; the revocation of the Edict of Nantes was signed here in 1685; here for nearly two years Pope Pius VII was detained a prisoner by Napoleon. Many state transactions and treaties are dated from Fontainebleau. In the palace Napoleon signed his abdication in 1814 and again in 1815. The palace has been restored and is kept in perfect condition as a public monument.

FONTAINEBLEAU, SCHOOL OF. A group of artists assembled by Francis I at Fontainebleau, where they were chiefly employed in decorating the palace. There were two branches of the school, one of which was composed of the native artists, of whom the Clouets (q.v.) were the most important, and who were Flemish in technic. The other branch was composed of Italians. Francis invited Leonardo da Vinci to France (1516-19), but he died too soon to make his influence permanently felt. The chief founders of the school of Fontainebleau were Rosso dei Rossi (1495-1541) and Primaticcio (1504-70), both Bolognese mannerists. Their successors in the decoration of the palace, whether Netherlands or French, labored in the same Italian style, which soon completely dominated French painting. The most prominent French representatives of the school were Jean Cousin (?1500-80) and Toussaint du Breuil (1561-1602). (See PAINTING.) The painters of Bar-

bizon (q.v.) are sometimes called the school of Fontainebleau (or Fontainebleau-Barbizon), because most of their subjects were taken from the forest of Fontainebleau, near which the village of Barbizon lies. Consult: Dimier, *French Painting in the Sixteenth Century* (London, 1904); Mübe, *Die erste Schule von Fontainebleau* (Breslau, 1904); Herbert, *Extraits d'actes et notes concernant des artistes de Fontainebleau* (2 vols., Fontainebleau, 1900-04); Smith, *Barbizon Days* (New York, 1902).

FONTAINE POWDER. See EXPLOSIVES.

FONTAN, fôn-tân', LOUIS MARIE (1801-39). A French dramatic author, born at Lorient. His name first became known through the drama of *Perkins Warbec* (1828). In 1829 he published an article, "Le mouton enragé," in *L'Album*, against Charles X and his family, which caused him to be sentenced to five years' imprisonment. The revolution of 1830 liberated him, and he continued writing constantly for the stage and generally with political intent. Among his plays are *Jeanne la folle* (1831) and *Le procès d'un maréchal de France* (1831).

FONTANA, fôn-tā'nā, CARLO (1634-1714). An Italian architect and archaeologist, born at Bruciato, near Como. He studied in Rome under Bernini and became one of his best pupils, but his work is heavy and ugly. He built the palaces of Grimazzi and Bolognetti, the tomb of Queen Christina in St. Peter's, the great fountains of St. Peter's, the façade of Santa Maria in Trastevere, and the church of San Michele a Ripa. The Villa Lichtenstein at Vienna was built from his designs in 1697. He wrote several books of great interest, such as *Il tempio vaticano e sua origine con gli edifici più cospicui antichi e moderni* (1694); *Utilissimo trattato delle acque correnti* (1696); *L'Anfiteatro Flavio* (1725).

FONTANA, fôn-tā'nā, DOMENICO (1543-1607). An Italian engineer and architect, born in 1543 at Mili in the vicinity of Lake Como. At an early age he went to Rome, where, as a protégé of Cardinal Montalto, he built the Villa Negroni (c.1580), the Sistine Chapel in Santa Maria Maggiore, and an adjoining palace. For his disinterested devotion in continuing these works at his own cost when his patron's fortunes failed, the Cardinal, when he later became Pope Sixtus V, rewarded him (1585) with important commissions, among which stands conspicuously the completion of the dome and lantern of St. Peter's, substantially upon Michelangelo's design, slightly modified by Della Porta. He increased his fame by the removal and reerection of the Egyptian obelisk in the Piazza of St. Peter's. He afterward erected the obelisks in the Piazza del Popolo and the Lateran and was intrusted by Sixtus with the construction of the Lateran Palace, of a new façade for the transept of the basilica of St. John Lateran, and of the famous Vatican library. In the construction of the aqueduct known as the Acqua Felice, with the fountain of the Acqua Paola, he was assisted by his brother Giovanni. On the death of Sixtus, Fontana was stripped of his post as papal architect in 1592, but found employment under the King of Naples, for whom he erected the Palazzo Reale and a noble promenade along the bay. His conception of a grander harbor was carried into effect by others, his death in 1607 at Naples depriving the undertaking of his personal superintendence.

Fontana's son, GRUGLIO CESARE, heir to his father's great wealth and some of his genius,

was appointed royal architect on his decease. Consult: Milizia, *Le vite dei più celebri architetti* (Rome, 1768), trans. by Cresy; *The Lives of Celebrated Architects, Ancient and Modern* (London, 1826). Modern authorities, with full illustrations, are Ebe, *Spät-Renaissance* (Berlin, 1886) and Strack, *Baudenkmäler Roms des 15-19 Jahrhunderts* (ib., 1891).

FONTANA, FELICE (1730-1805). A celebrated Italian physiologist. At the termination of an elaborate course of study carried on in the universities of Verona, Parma, Padua, and Bologna, he was appointed to the chair of philosophy in the University of Pisa by Francis I, Grand Duke of Tuscany. Leopold, on succeeding his father, appointed Fontana court physiologist and charged him with the organization of a museum of natural history and physiology, which comprises a superb collection of specimens of the animal, vegetable, and mineral kingdoms, besides an elaborate series of wax models, representing the human body as a whole, and each organ separately. A similar collection was prepared by Fontana for the Museum of Vienna by order of the Emperor Joseph II. His writings include: *Ricerche filosofiche sopra la fisica animale* (1781); *Dei moti dell' iride* (1765); *Traité sur le venin de la vipère et sur les poisons américains* (1781); *Choix d'observations physiques et chirurgicales* (1785).

FONTANA, GIOVANNI (1540-1614). An Italian architect, born at Mili near Lake Como, the elder brother of the more famous Domenico Fontana (q.v.), whom he assisted in many of his works. He designed the Giustiniani Palace in Rome but achieved greater fame as an engineer of water works than as an architect. Among his most famous works were the fountains of the Vatican Gardens, and of the Villa Mondragone at Frascati, and he had a hand in the design of the Acqua Paola at Rome. He superintended the cleansing of the Tiber, built canals, restored the Cloaca Maxima, built the aqueducts at Loretto and Recanati, and erected the walls or parapets around the cascades at Tivoli. In 1592 he became papal architect under Clement VIII (1592-1605).

FONTANA, LAVINIA (1552-1614). An Italian painter of the Bolognese school. She was the daughter and pupil of Prospero Fontana. She painted religious, historical, and mythological canvases, but was especially famous as a fashionable portrait painter. Her reputation, however, has waned. She lived at Bologna, then at Rome, where she was made a member of the Academy of St. Luke. Among her best portraits are those of Pope Gregory XIII, and that of herself, in possession of Count Zappi da Imola. Her husband, Paolo Zappi, an amateur, assisted her in her painting. She is represented in the galleries of Bologna, Florence, Milan, Rome, Dresden, Berlin, Madrid, and in the Hermitage, St. Petersburg.

FONTANA, PROSPERO (1512-97). An Italian painter of the Bolognese school. He belonged to the Mannerist group, having studied in Bologna under Innocenzio da Imola; he was, however, more influenced by the works of Vasari. Upon the recommendation of Michelangelo he was employed by Pope Julius III at Rome, and afterward assisted Primaticcio in decorating the Palace of Fontainebleau. The rest of his life was passed at Bologna, where he died in 1597. He exercised much influence upon the art of Bologna—of a detrimental nature, according to

Lanzi—and numbered among his pupils the Carracci (q.v.), who deserted his methods, Calvaert, and others. He was a painter of great facility, but of incorrect and negligent methods. His best works are at Bologna, and his portraits are better than his historical compositions. He is also represented in the Dresden Gallery, the Brera (Milan), and the Borghese Gallery (Rome).

FONTANE, fôn'tân', MARIUS (1838-). A French author, born at Marseilles. He became secretary to Ferdinand de Lesseps, who made him general secretary of the Suez Canal Company, and later a member of the board of directors of the Panama Canal Company. Upon revelations connected with the latter enterprise he was condemned to two years' imprisonment, but later was acquitted (1893). His publications enter many fields and include: *Confidences de la vingtième année* (1863); *Sélim Végorgeur* (1865); *La guerre d'Amérique* (2 vols., 1866); *L'Histoire universelle* (vol. i, 1881; vol. x, 1899; unfinished).

FONTANE, fôn-tā'ne, THEODOR (1819-98). A noteworthy German author, of French descent, born at Neuruppin (Brandenburg). After study at the Industrial School of Berlin and three years (1840-43) spent as an apothecary's apprentice at Leipzig and Dresden, he turned to the more congenial activities of journalism and literature. He was an editor on the staff of the *Neue Preussische Zeitung* from 1860 to 1870 and from 1870 to 1889 wrote authoritatively as dramatic critic for the *Vossische Zeitung*. In 1870 he visited the scene of war in France and was taken prisoner at Domrémy. He was a close student of the thought and literature of England, where he resided in 1844, 1852, and 1855-59, chiefly for the purpose of investigating the old ballads which had so important an effect upon his own earlier work as a poet. In 1876 he was elected first secretary of the Berlin Academy of Arts and in 1891 received 3000 marks from the German Emperor in recognition of his services to German literature. He published two collections of verse: *Gedichte* (1851; 8th ed., 1902) and *Balladen* (1861), of whose contents such poems as "Archibald Douglas," done in the very spirit of their English prototypes, placed him among the foremost modern ballad writers. Volumes based on his observations in Great Britain—*Aus England* (1860); *Jenseit des Tweed* (1860)—or on the Franco-Prussian War—*Kriegsgefangen* (1871, 6th ed., 1904); *Der Krieg gegen Frankreich* (1873-75)—were much esteemed in Germany, and his *Wanderungen durch die Mark Brandenburg* (1861-82; numerous subsequent editions) established him as the peculiar interpreter of that region. It was from Brandenburg also that he drew the material for many of the novels that made him famous. These began in 1878 with *Vor dem Sturm* and closed with his masterpieces, *Effi Briest* (1895) and *Der Stechlin* (1899). His *Irrungen, Wirrungen* (1888; 8th ed., 1902) is credited with the introduction of what has become known as the Berlin type of fiction. It certainly allied him with the younger school, the so-called realists. But his realism was quite individual and dominated by his own kindly personality. After the death of Freytag (1895) he occupied a position of prominence in European literature. No notice of him would be complete without mention of his reminiscences, *Meine Kinderjahre* (1894), and *Von Zwanzig bis Dreissig* (1898).

Consult Servaes, *Theodor Fontane* (Berlin, 1900), and Erich Schmidt, in *Charakteristiken*, vol. ii (ib., 1901).

FONTANEL' (Fr. *fontanelle*, dim. for *fontaine*, fountain, from ML. *fontana*, fountain, from Lat. *fons*, fount). One of the soft pulsating spots on the head of a very young infant. Of these there are three or four, the principal one being at the crossing of the sagittal and coronal sutures. This is the great or anterior fontanel. The next in importance is the posterior fontanel, at the junction of the sagittal and lambdoidal sutures. The others, called the sphenoidal and the mastoidal or Gasserian fontanels, close very soon after birth, while the posterior closes a few months, and the anterior about two years, after birth. Synchronously with the pulse beat the brain pulsates through the fontanels and may be fancied to resemble the water of a fountain. The term was also applied to an artificial ulcer, formerly caused by physicians for its derivative effect. Any hard mass kept under the skin for a time will produce the necessary irritation, such as a dried pea bandaged into a cut in the skin. This causes a discharge of pus, formerly supposed to drain away the material of disease from another part of the body. The method and idea are obsolete.

FONTANES, fôn'tân', LOUIS, MARQUIS DE (1757-1821). A French poet and political orator. He was born at Niort, March 6, 1757, and was of an ancient Protestant family of Languedoc. At 21 he attracted attention as poet by *Le cri de mon cœur* (1778) and *La forêt de Navarre* (1778). A little later he published a scholarly translation of Pope's *Essay on Man* (1783). During the early years of the Revolution he was active as a moderate Republican journalist and before the fall of Robespierre was in hiding for a time. Later he was constrained to take refuge in Hamburg, whence he went to London and became a close friend of Chateaubriand. While in England he published a much-admired imitation of Gray's "Elegy," *Le jour des morts* (1796). He returned to France in 1799, was reinstated in the Institute, of which he had been made a member in 1795, and, warmly espousing the cause of Napoleon, was made member of the legislative body (1802-10), of which he became president in 1804. Here he developed great oratorical talent in praise of the First Consul and Emperor. As Grand Master of the *Université* (1808-15), he was Napoleon's dispenser of literary favors and often his literary spokesman, as when he composed the *Eloge* on Washington. He was advanced to the Senate (1810), but he adapted himself readily to the Restoration after Leipzig, drew up Napoleon's act of abdication (1814), and was made peer by Louis XVIII. He died in Paris, March 17, 1821. Fontanes's works, edited by Sainte-Beuve in two volumes (1839), are models of elegant and correct diction and show sound literary judgment. Consult A. Tornézy, *Fontanes; étude biographique* (Poitiers, 1901), and G. Vauthier, "Fontanes et les débuts de l'Université" (*Nouvelle Revue*, Paris, 1908).

FONTANGES, fôn'tânzh', MARIE ANGÉLIQUE DE SCORAILLE DE ROUSSILLE, DUCHESSE DE (1661-81). A mistress of Louis XIV, born at the Château of Croprières in Auvergne, the daughter of the Marquis de Roussille. Maid of honor to Madame the Duchess of Orléans, she attracted the attention of the King, who made her Du-

chesse de Fontanges, discarding in 1679 the Marquise de Montespan, who had put her forward to offset the influence of Maintenon. She bore the King a son, who died in infancy. She died shortly afterward at the abbey of Port Royal—probably a natural death, though poison was suspected. An extremely high coiffure was called Fontange after her.

FONT'ARA'BIA. See FUENTERRABIA.

FONT-DE-GAUME CAVERN, fôn'de-gôm'. See PALEOLITHIC PERIOD.

FONTE, BARTOLOME. See FUENTES.

FONTENAY-LE-COMTE, fôn'tnâ'le-kôm'té. The capital of an arrondissement in the Department of Vendée, France, situated on both banks of the Vendée, 27 miles northeast of La Rochelle (Map: France, N., E 6). It is an old-fashioned town, with the two fine Gothic churches of Notre Dame and Saint-Jean, and in the public square a fountain in the Gothic style, from which the town derives its name; there are also a college and a handsome theatre. There are linen and cloth and saw mills, and three important annual fairs are held. Pop., 1901, 10,512; 1911, 10,379. The town suffered considerably during the religious wars and was captured by the Vendéans in 1793, after two severe battles.

FONTENAY-MAREUIL, fôn'tnâ-mâ'rë'y', FRANÇOIS DU VAL, MARQUIS DE (c.1594-1665). A French soldier and diplomat. He was brought up at the court of Louis XIII; served with Mayenne in Spain; with Nevers at Ratisbon; under Boisdauphin at the siege of Soissons (1617); in 1619 in Normandy; at Saint-Jean d'Angély, Clérac, and Montauban (1621); at Saint-Antoine and Montpellier (1622); at the Ile de Ré (1627); and at the sieges of La Rochelle (1628), of Privas, and of Alais (1629). He was Ambassador to England in 1630-33 and, after taking part in various campaigns against the Imperialists and Spaniards, at Rome (where Mazarin instructed him to foment a rebellion in Naples) from 1640 to 1650. His memoirs were published at Paris in 1826.

FONTENELLE, fôn'tnêl', BERTRAND LE BOVIER DE (1657-1757). A French scientist, Cartesian philosopher, poet, and dramatist. He was born at Rouen, Feb. 11, 1657, and was a nephew of Corneille. He was trained by the Jesuits, studied law, but abandoned it for literature and science, in which he soon earned distinction. He was secretary of the Academy of Sciences from 1699 to 1741 and edited with admirable care its *Mémoires* and *Eloges* on deceased members; in these he gave the most lucid summaries of the philosophical and scientific labors of his day. His dramatic and poetic work is negligible, but his literary studies on the French stage before Corneille and the origin of fables are still of interest. His *Histoire des oracles* (1687), *Entretiens sur la pluralité des mondes* (1686), and the *Dialogues des morts* (1683), with their clean-cut arguments and most attractive style, prepared the ground for the scientific and rationalistic spirit, by popularizing the most abstruse subjects, such as astrology and even the history and philosophical explanation of human superstitions. Thus, lacking a month of being a centenarian, he was the most important connecting link between the great stylists of the seventeenth century and the philosophers of the eighteenth century. As a frequenter of the famous salons of Madame de Lambert, Madame de Tencin, and Madame Geoffrin, he was the literary arbitrator of his contemporaries. The best edition of his

works is in three volumes (Paris, 1818). Consult: Faguet, *Dix-huitième siècle* (Paris, 1894); the brief but acute criticism in Lanson, *Histoire de la littérature française* (12th ed., ib., 1912); Maigron, *Fontenelle* (ib., 1906); Thorold, *Six Masters in Disillusion* (New York, 1909).

FONTENOY, fɔ̃t'noʁ (older form, *Fontenet*, from Lat. *fontanus*, pertaining to springs, from *fons*, fountain). A village of Belgium, in the Province of Hainaut, 5 miles southeast of Tournai (Map: Belgium, B 4). Here, on May 11, 1745, the French, about 50,000 strong, under Marshal Saxe, defeated nearly an equal number of English, Hanoverians, and Dutch under the Duke of Cumberland. The fight was obstinate to the last and was decided only by a smashing charge of the Household Troops and the famous Irish Brigade. The Allies lost 8000 men, the French 7000. Coming at the same time as the threatened Stuart invasion, the defeat was a great blow to England. Consult H. Pichat, *La campagne du maréchal de Saxe, de Fontenoy à Bruxelles* (Paris, 1909).

FONTENOY. A village near Auxerre, Department of Yonne, in Lower Burgundy. It is memorable for the battle fought there, June 25, 841, between the three sons of Louis the Pious, which decided the fate of the Carolingian Empire. The Emperor Lothair, who was defeated, was obliged in 843 to divide the Empire with his two brothers by the Treaty of Verdun (q.v.). Pop., 1901, 716; 1911, 633.

FONTEVRAULT, fɔ̃t'vʁɔ' (Fons Ebraldi—the well of Saint-Evrault). A town in the Department of Maine-et-Loire, France, on the Vienne, 8 miles southeast of Saumur. Pop., 1901, 2352; 1911, 2248. It is celebrated for the remains of the famous abbey founded in 1099 by Robert d'Arbrissel, a Breton monk. It consisted of five churches, a monastery, a nunnery, a magdaleneum, and a hospital. One church remains, a splendid example of twelfth-century architecture, of which only a part is now devoted to divine service. It contained the tombs of several members of the royal Plantagenet family of England and still possesses the effigies of Henry II and his Queen Eleanor of Aquitaine, of Richard Cœur de Lion, and of Isabella of Angoulême, wife of King John. The Tour d'Evrault, the sixteenth-century chapter house, the refectory, and the cloisters are of great archaeological interest. In 1804 the buildings were inclosed by walls and converted into a huge penitentiary and industrial prison for 11 neighboring departments, with accommodation for 2000 prisoners. Napoleon III, in 1867, occasioned a national outburst of indignation by offering the Plantagenet statues to Queen Victoria, a vandal act that was frustrated by the refusal of the prison director to deliver them to the English agent. Consult Edouard, *Fontevault et ses monuments* (2 vols., Paris, 1875), and Bosseboëuf, *Fontevault, son histoire et ses monuments* (Tours, 1890).

FONTEVRAULT, ORDER OF. A monastic order following the Benedictine rule, founded by Robert d'Arbrissel. He was born in 1047 and took his doctor's degree in Paris. As vicar-general of the diocese of Rennes, he devoted himself zealously to the extirpation of clerical concubinage and simony. Later he took up the life of a hermit in the forest of Craon, between Anjou and Brittany. The fame of his sanctity attracted disciples, whom in 1094 he formed into a community under the rule of St. Augustine at

La Roe. He received special permission from Pope Urban II to preach the Crusade; but in 1099 he founded a community at Fontevault (q.v.) for persons of both sexes who preferred a life of penance at home. As several houses developed, of which those for women were especially dedicated to the Blessed Virgin, Robert placed those for men also under the jurisdiction of the Abbess of Fontevault as superior of the whole order, representing the heavenly patroness. The first abbess was Petronilla of Chemillé. They were pledged to observe the Benedictine rule in its full rigor, not eating flesh even in sickness. Paschal II confirmed the order in 1106 and 1112. The founder died in 1117, after establishing numerous cloisters; more than 60 arose after his death on the same model, principally in France, though a few extended to England and Spain. The order ultimately declined, in spite of the efforts at reform of three of its abbesses, Mary of Brittany (1477), Renée of Bourbon (1507), and Antoinette of Orléans (1571-1618), and finally became extinct. In 1803 a Fontevrist nun began a school at Chemillé, the home of the first abbess, from which grew a modest revival of the order, numbering three houses in 1849. Consult Malifaud, *L'Abbaye de Fontevault* (Angers, 1866), and *Bibliographie des Benedictins de la Congregation de France* (new ed., Paris, 1906).

FONTHILL ABBEY. See BECKFORD.

FONVIELLE, fɔ̃v'yɛl', LOUIS EUGÈNE, KNIGHT OF (1655-1711). A French pirate, born at Thouars (in the present Department of Deux-Sèvres). He became a privateer in 1674, turned buccaneer in 1677, and in command of his own vessel cruised among the West Indies, attacking and plundering the Spaniards. He was a lieutenant in the French navy from 1679 to 1681, when he was elected chief of the buccaneers, whom he held in readiness to aid the French at Santo Domingo. When the French expedition against Cartagena was organized by Baron de Pointis in 1697, he commanded 600 buccaneers. In 1702 he helped Ducasse, Governor of Santo Domingo, to defeat a superior English fleet under Admiral John Benbow. He accompanied Duler's unsuccessful French expedition against Rio de Janeiro in 1710 and after his surrender was murdered by the Spaniards.

FONVIELLE, WILFRID DE (1824-1914). A French aéronaut, meteorologist, and author. He was born at Paris and in his early life was a teacher of mathematics. After 1858 he gained distinction as an aéronaut. He made numerous balloon ascents with Tissandier for meteorological purposes, and in November, 1870, during the siege of Paris, he escaped from the city in a balloon and proceeding to London gave a series of lectures on the benefits of a republican form of government. His principal scientific works are: *L'Homme fossil* (1865); *Les merveilles du monde invisible* (1866); *Eclairs et tonnerres* (1867), trans. into English under the title of *Thunder and Lightning*; *L'Astronomie moderne* (1868); *Histoire de la lune* (1866); *Mort de faim* (1886). An account of the balloon ascents made by Fonvielle, Glaisher, and others appeared in French in 1870, and an English translation was published in 1871 under the title of *Travels in the Air*. In addition to the above-mentioned works Fonvielle wrote several political pamphlets and *Aventures aériennes* (1876) and *La prévision du temps* (1879).

FOOCHOW. (Fu-chau or Fuhchow, Chin.,

Happy Region). A walled city of China, capital of the Province of Fookien, and one of the five ports opened to foreign residence and trade by the treaty negotiated by the British at Nanking in 1842. In the local dialect the name is Hok-chiu.

Foochow is well situated in a beautiful and fertile plain, on the river Min, about 34 miles from its mouth. The city proper lies nearly 3 miles from the north bank and is surrounded by a wall about 30 feet high. Suburbs extend to the river and also occupy the opposite bank. Foochow is the port of the rich district included in the valley of the Min and its tributaries, one of the great tea-growing areas. The walls, which have a circuit of about $6\frac{1}{2}$ miles and are pierced with seven massive gates surmounted with lofty towers, inclose three finely wooded hills—Black Rock Hill, in the southwest angle; the Hill of the Nine Genii, in the southeast; and Screen Hill, in the northeast. The eastern part of the inclosure is known as the Tatar town, a garrison having been established here by the conquering Manchus in the seventeenth century. The principal street of the city runs from north to south and is continued through the south gate by a long causeway to and through the city's most populous and most important suburb on the river bank. From this point a celebrated stone bridge—the Bridge of Ten Thousand Ages—leads across the river to a densely peopled little island, Tongchui (Middle Island), and from this island another stone bridge, 300 feet in length, completes the line of communication with the foreign settlement on the island of Nantai. The Bridge of Ten Thousand Ages is said to have been built over eight centuries ago. It is 1350 feet long, about 14 feet in width, and is formed of a granite causeway laid upon thick stone slabs 45 feet long, which rest on about 40 immense stone piers. Strong stone parapets mortised into large stone pillars protect pedestrians. This is the limit of navigation for seagoing junks; but barges and smaller craft with movable masts may pass under the bridge. Foreign vessels, except those of very light draft, anchor lower down at Pagoda Island, which lies off the lower end of Nantai Island.

Near here, on the left bank of the river, are the arsenal and navy yard, established in 1867 and managed by Frenchmen. Many war vessels have been launched here, and most of the naval officers of China were trained in the school of navigation attached to the arsenal. In 1884, during hostilities with France, the arsenal and the fortifications in the neighborhood suffered greatly from a brief bombardment by the French. Foochow has modern wharfs for shipping, a dry dock 300 feet long, and factories for the manufacture of cotton and silk fabrics, and paper. Among the other articles produced are "soap-stone" or steatite figures, vases, and other ornamental objects, artificial flowers, and figures of birds carved in charcoal and colored to represent the living originals. Foochow lacquer is also well known.

Foochow was opened to foreign commerce in 1842, but it was not until 1853 that the tea trade of the port began to assume any importance. In 1912 the net value of the trade of the port was \$13,579,000, of which \$6,376,000 represented native produce of local origin sent to foreign countries and \$5,460,000 the imports from foreign countries. The foreign trade has suffered in a diminished export of teas and

import of opium. The chief articles imported from foreign countries included cotton goods, lead, tin, tin plate, steel, kerosene oil, machinery, flour, and sugar; and the chief exports were timber, wood for kerosene-oil cases, tea, canes, matches, and various kinds of fruit.

In 1912 there were 679 vessels engaged in coastwise and foreign trade with this port, with a tonnage of 520,534.

The port is now connected by telegraph with the principal cities of China and by cable with Formosa, Hongkong, and Europe. There is fortnightly connection with Hongkong by steam.

Foochow is the residence of the Governor of Fookien province and of the Viceroy, or Governor-General, of the united provinces of Chekiang and Fookien.

The population of the city, including its seven suburbs, has been estimated at 624,000.

Bibliography. For a good description of the city, see Doolittle, *Social Life of the Chinese* (New York, 1867), and Mayers and others, *The Treaty Ports of China and Japan* (London, 1867). For statistics, consult the annual reports of the Maritime Customs of China. For the language, consult Maclay, *Manual of the Foo-chow Dialect*, and Maclay and Baldwin, *Chinese-English Dictionary* (1871).

FOOD (AS. *fōda*, Icel. *fæði*, Goth. *fōdeins*, food; connected with Gk. *παρίσθαι*, *pateisthai*, to feed). The articles of animal and vegetable origin that form the diet of man. Sometimes this term includes also spices, vinegar, and similar articles which, strictly speaking, are not foods, but are more properly called food accessories or condiments.

The food of any individual or family is to a very large extent determined by circumstances. Anthropologists claim, and with good reason, that in the earliest days of the human race man lived without much choice on the food which he could obtain, being fitted by his inheritance from earlier forms of life to use a large variety of food stuffs.

In considering the human race as a whole there are three great epochs in man's diet, viz.: (1) the early hunting period, in which man depended entirely on a natural supply of both animal and vegetable food; (2) the cooking period, in which man still used a natural supply of food but prepared it for use with the aid of heat; and (3) the so-called cibicultural, or food-producing, period—i.e., the period in which man has depended upon the cultivation of both flocks and herds and field and garden crops to supplement a wild supply of food.

Civilized man still obtains his fish supply largely from the rivers and other waters, but with this exception he has come to depend almost wholly on a food supply which is produced through his own efforts directed in the various lines of agriculture.

In general, the food habits of the human race are an expression of the thousands of years of experience in which man has sought to bring himself into harmony with his environment, and food habits have been determined, as regards materials selected, by available supply, man being by nature omnivorous.

A study of food and the feeding of the body, i.e., nutrition, should include knowledge of the requirements and the chemical composition of the body, the chemical composition, the laws of energy and of the metabolism of matter. Account must be taken of methods of preparing

and cooking foods, of the hygiene, the comparative pecuniary value, the quantities of foods eaten, etc. Some of these subjects require investigations by specially devised methods; others are carried on by the help of physiological chemistry, bacteriology, and other related sciences. From the standpoint of nutrition, food may be defined as substance that builds, repairs, and maintains tissue or yields energy, or does both, when taken into the body. The most healthful food is that which is best fitted to the needs of the user; the cheapest food is that which furnishes the largest amount of proper nutriment at the least cost. In general, the best food is that which is both the cheapest and the most healthful.

The substances that nourish the body are very similar in chemical composition to those that compose it. They are made up of from 15 to 20 chemical elements, the most abundant of which are oxygen, hydrogen, carbon, nitrogen, calcium, phosphorus, and sulphur. The elements are combined in a great variety of ways in the compounds of both the food and the body. Five general classes of these substances are made as follows: water, mineral matter, the protein group, or total nitrogenous matter, fats, and carbohydrates, the first two of which are called inorganic, the other three organic. In addition to material supplied in food, the body requires the oxygen of the air for the oxidation of nutrients and the production of energy.

Inorganic Constituents. Water is the most abundant of the substances mentioned. It is a component part of all the tissues and forms over 60 per cent by weight of the body of the average man. Though very important physiologically, it neither builds tissue nor yields energy. Other food ingredients which yield little or no energy, and yet are indispensable to the body, are the mineral matters, i.e., those substances that remain as ash when body or food tissue is burned. They consist mainly of phosphate of lime or calcium phosphate, the mineral basis of bone, and numerous compounds of potassium, sodium, magnesium, and iron. They form only 5 or 6 per cent, by weight, of the body, and are found chiefly in the bones and the teeth, but are present in the other tissues and also in solution in the various fluids.

Organic Constituents. The organic compounds are so called because they occur principally in the organic, i.e., the animal and vegetable world. They all contain carbon, oxygen, and hydrogen, in varying proportions. Some also contain nitrogen, phosphorus, sulphur, or other elements. **Protein Group.**—The protein group includes all compounds that contain nitrogen; e.g., the lean and gristle of meat, the white of eggs, and the gluten of wheat. In proximate analyses protein is estimated by multiplying the total nitrogen by 6.25 or some similar factor. Protein forms about 18 per cent, by weight, of the body of the average man. Among the protein constituents of foods, the true proteins (or proteids) are complex—usually amorphous compounds of different composition and properties, but all having high molecular weight. They are regarded as being essentially anhydrides of amino acids. Protein is the organic basis of bone, muscle, and other tissues, and is essential to the body structure. Proteins are also used as fuel—that is, are burned in the body to yield energy—and are to some extent transformed into fat and stored in the body, but these are the less

important uses. The protein compounds are most abundant in some of the animal foods, as lean meat, though the cereals contain them in considerable, and dried peas and beans in large, proportions. The protein group contains other nitrogenous compounds besides the true proteins, including the so-called "nitrogenous extractives," alkaloids, nitrogenous fats, and essential oils, and some inorganic compounds as ammonium salts. With the exception of some of the extractives, however, the amount of the non-protein compounds in body tissue or in foods is small, and true proteins and their immediate derivatives make up nearly all of the nitrogenous material, or "protein group," in nutrition. **Fats.**—Fats occur chiefly in animal foods, as meats, fish, butter, etc., but in considerable quantities in some cereals, notably oatmeal and maize (whole kernel), and in various nuts. They are also abundant in some vegetable products, such as olives and cottonseed, from which they are expressed as oil. In our bodies and in those of animals fats occur in minute particles scattered through the various tissues and in masses under the skin and in other localities. The amount of fat in the body varies greatly with food, exercise, age, and other conditions. When more food is taken than is necessary for immediate use, part of the surplus may be stored in the body. The protein and fat of food may thus become body protein and body fat; sugar and starch of food are changed to fat in the body and stored as such. When the food supply is short, this reserve material is drawn upon for supplementary fuel. Fats form about 15 per cent, by weight, of the body of an average man. Fats in food analyses are often termed "ether extract" and include some substances (as wax) which are not true fat. **Carbohydrates.**—The carbohydrates, which include such compounds as starches, different kinds of sugar, and the cellulose or fibre of plants, are found chiefly in the vegetable foods, like cereal grains and potatoes, and form only a very small proportion of the body tissues—less than 1 per cent. Milk, however, contains considerable amounts of milk sugar, which is a carbohydrate. Starches and sugars, which are very abundant in ordinary vegetable food materials, are important food substances, because they are easily digested and because they form an abundant source of energy. They may be and often are transformed into fat in the body. In food analysis "total carbohydrates" are usually determined by difference, and the group then may include organic acids, e.g., as well as true carbohydrates.

To a greater or less extent the different nutrients can do one another's work. If the body has not enough of one kind of fuel, it can use another. But while protein may be burned in the body in the place of fats and carbohydrates, neither of the latter can take the place of the proteins in building and repairing the tissues. By being consumed themselves, however, they protect the proteins from consumption, but they cannot replace protein as tissue builder.

Recent investigations have led to the conclusion that certain substances are present in foods in very small quantities which, minute as they are, are essential for nutrition. "Vitamin" is a name given to such substances. Vitamins are found in green plants, in the bran layer of cereal grains, in beans, milk, and other foods, both animal and vegetable.

Refuse. Food as it is bought at the market,

or even as it is served on the table, contains more or less of materials—such as the bones of meat and fish, the shells of eggs, and the skins and seeds of fruits and vegetables—which we cannot or do not eat and which would have little or no nutritive value if we did eat them. In discussing the chemical composition of foods such portions are usually counted as refuse, but they make an important item when we consider the actual cost of the nutrients of food. The materials grouped together as refuse contain, in part, the same ingredients as the edible portions, though usually in very different proportions. Thus, bones are largely mineral matter, with some fat and protein; egg shells are almost entirely mineral matter; bran of wheat has a high content of fibre or woody material.

The Body as a Machine. Blood and muscle, bone and tendon, brain and nerve—all the organs and tissues of the body—are built from the nutritive ingredients of food. With every motion of the body, with the exercise of feeling and of thought, material is consumed and must be resupplied by food. In a sense the body is a superior machine, and, like other machines, it requires material to build up its several parts, to repair them as they are worn out, and to serve as fuel. In some ways it uses this material like a machine; in others it does not. The steam engine gets its power from fuel; the body does the same. In the one case coal or wood, in the other food, is the fuel. In both cases the energy—the potential energy—which is latent in the fuel is transformed into heat and power; and so the body is a prime mover. As an engine, it has an efficiency of 25 per cent for external muscular work. When coal is burned in a furnace, part of its potential energy is transformed into the mechanical power which the engine uses for its work; the rest is wasted in the heat that the engine does not utilize. Likewise the potential energy of the food is transformed in the body into mechanical power and heat. The mechanical power is employed for the internal work of the body (circulation of the blood, etc.) and for external muscular work. The heat which results from the utilization of food in the body is used to keep the body warm, and when more is generated than is needed for that purpose it is wasted, as in the case of the engine. However, the body is much more economical in the use of fuel than any engine. One important difference between the human machine and the steam engine is that the former is self-building, self-repairing, and self-regulating. Another is that the material of which the engine is built is very different from that which it uses for fuel, but part of the material which serves the body as a source of energy also builds it up and keeps it in repair. Furthermore, the body can use its own substance for fuel; the steam engine cannot.

The energy value of food may be readily determined by burning samples in a bomb calorimeter, in an atmosphere of oxygen to secure ready and complete combustion. The heat given off passes through the walls of the bomb and is taken up by a known volume of water of known temperature. From the increase in the temperature of the water the amount of heat liberated is calculated. The unit commonly used to express the energy value of food, as well as often energy in general, is the calorie, i.e., the amount of heat which would raise the temperature of one kilogram of water 1° C., or, what is

nearly the same thing, one pound of water 4° F. Instead of this, a unit of mechanical energy—the foot ton, e.g., may be used. This represents the force required to raise a weight of one ton to the height of one foot. One calorie is equal to very nearly 1.54 foot tons; i.e., one calorie of heat, when transformed into mechanical power, would suffice to lift one ton 1.54 feet. Taking our common food materials as they are used in ordinary diet, the following general estimate has been made for the energy furnished to the body by one gram or one pound of each of the classes of nutrients:

Protein, fuel value, 4 calories per gram, or 1820 calories per pound.

Fats, fuel value, 9 calories per gram, or 4080 calories per pound.

Carbohydrates, fuel value, 4 calories per gram, or 1820 calories per pound.

When we compare the nutrients in respect to their fuel value—i.e., their capacities for yielding heat and mechanical power—it will be seen that a pound of protein of lean meat or albumen of egg is just about equivalent to a pound of sugar or starch, and a little over two pounds of either would be required to equal a pound of the fat of meat or butter or of body fat.

The following table shows the average composition as purchased of a number of the more common materials. For the composition of others, see BUTTER; EGGS; FRUIT; MEAT; MILK; CHEESE; NUTS; VEGETABLES; WHEAT; MAIZE; BUCKWHEAT; FIG; ETC.

Digestibility. Not only is composition considered in valuing a food, but digestibility also. Digestibility is a term used to indicate the thoroughness of digestion, i.e., the amount of a given food which the body retains for its uses when the food passes through the digestive tract. The term is also used, though much less exactly, with reference to the agreement or disagreement with an individual of some given food or with reference to the supposed ease or difficulty with which a food parts with its nutrients to the body. The changes which food undergoes in digestion are brought about by ferments which are secreted by the digestive organs. (See ALIMENTARY SYSTEM; DIGESTION, ORGANS OF.) The ptyalin of saliva in the mouth changes some insoluble starches into sugar. The food does not remain in the mouth for a long time, but nevertheless the action of the saliva is considerable. Saliva also helps to prepare the food for the stomach by moistening it and making its texture such that the digestive juice of the stomach may readily act upon it. The gastric juice acts upon protein; the pancreatic juice of the intestine (see PANCREAS) upon protein, fat, and carbohydrates. All the digestive juices are assisted by a fine division of the food in chewing and by muscular contractions, called the peristaltic action of the stomach and intestine. These latter motions help to mix the digestive juices and their ferments with the food. The nutrients of food are broken up into simpler compounds by digestion. The cleavage products of the nutrients find their way through the walls of the alimentary canal into the circulation, and in this passage and later undergo remarkable changes. When finally the blood, supplied with nutrients of the digested food and laden with the oxygen from the lungs, is propelled from the heart all over the body, it is ready to furnish the organs and tissues with the materials and energy needed for the various

TABLE I.—AVERAGE COMPOSITION OF SOME COMMON ANIMAL FOOD PRODUCTS

FOOD MATERIALS (AS PURCHASED)	Refuse	Water	Protein	Fat	Carbo- hydrates	Ash	Fuel value per pound
ANIMAL FOOD	%	%	%	%	%	%	Calories
Beef, fresh:

* Plain confectionery not containing nuts, fruit, or chocolate.

† Such vegetables as potatoes, squash, beets, etc., have a certain amount of inedible material, skin, seeds, etc. The amount varies with the method of preparing the vegetables, and cannot be accurately estimated. The figures given for refuse of vegetables, fruits, etc., are assumed to represent approximately the amount of refuse in these foods as ordinarily prepared.

†† Fruits contain a certain proportion of inedible materials, as skin, seeds, etc., which are properly classed as refuse. In some fruits, as oranges and prunes, the amount rejected in eating is practically the same as refuse. In others, as apples and pears, more or less of the edible material is ordinarily rejected with the skin and seeds and other inedible portions. The edible material which is thus thrown away, and should properly be classed with the waste, is here classed with the refuse. The figures for refuse here given represent, as nearly as can be ascertained, the quantities ordinarily rejected.

§ Milk and shell.

¶ The average of five analyses of cereal coffee grain is: Water 6.2, protein 13.3, fat 3.4, carbohydrates 72.6, and ash 4.5 per cent. Only a portion of the nutrients, however, enter into the infusion. The average in the table represents the available nutrients in the beverage. Infusions of genuine coffee and of tea like the above contain practically no nutrients.

functions. At the same time the blood stream carries away the waste which the exercise of these functions has produced. The living body tissue has the power of choosing the necessary materials from the blood and building them into

its own structure. Just how this is done cannot be explained. That portion of the food which the digestive juices cannot break up into units suitable for assimilation, or which for some reason escapes digestion, is periodically

excreted as feces. This material includes not only indigestible material and particles of undigested food, but also the so-called metabolic products, i.e., residues of the digestive juices, bits of the lining of the alimentary canal, etc. For discussions of other excretory products, see URINE; SWEAT; RESPIRATION, ORGANS OF.

The thoroughness of digestion of any food may be learned most satisfactorily by experiments with man, although experiments are also made by methods of artificial digestion. In the experiments with man both food and feces are analyzed. Deducting the amounts of the several nutrients in the feces from the total amounts of each nutrient consumed shows how much of each was digested. The results are usually expressed in percentages and spoken of as coefficients of digestibility. From a large number of experiments with man it has been calculated that on an average the different groups into which food may for convenience be divided have the following coefficients of digestibility and fuel value per pound:

TABLE II.—COEFFICIENTS OF DIGESTIBILITY AND AVAILABILITY OF ENERGY OF DIFFERENT GROUPS OF FOOD

KIND OF FOOD	Protein	Fat	Carbohydrates	Availability of energy
	Per cent	Per cent	Per cent	Per cent
Meat and fish	97	95	98	87
Eggs	97	95	98	89
Dairy products	97	95	98	93
Total animal foods of mixed diet	97	95	98	89
Cereals	85	90	98	91
Legumes, dried	78	90	97	83
Sugars and starches	83	90	98	96
Vegetables	85	90	95	91
Fruits	85	90	90	88
Total vegetable foods of mixed diet	84	90	97	92
Total food	92	95	97	91

By the aid of these factors and the figures for the composition of food, the digestible nutrients in different materials may be calculated. Such data may be found in the usual reference works on food and nutrition.

Ease and Quickness of Digestion. As a general thing, the term "ease of digestion" refers to the agreement or disagreement of a food with an individual, and "quickness of digestion" to the length of time food remains in the stomach—which is only a step in digestion (though an important one, particularly for protein foods), for digestion continues after the food has passed into the intestine, where fats and carbohydrates are digested as well as any protein not digested in the stomach. The length of time food remains in the stomach has often been studied. It varies with many factors, including the quantity eaten, the kind and the mixture of foods. Small test meals may disappear from the stomach in one to four hours, and a test meal less abundant than an ordinary hearty dinner only after seven hours.

The period of digestion, as a whole, varies apparently with individuals and circumstances. It is a common thing for persons to excrete as feces on one day the residue from the food eaten the day before.

Agreement of Food with Individuals. Digestibility is often confused with another very different thing, viz., the agreeing or disagreeing of food with the person who eats it. Different persons are differently constituted with

respect to the chemical changes which their food undergoes and the effect produced, so that it may be literally true that "one man's meat is another man's poison." Milk is for most people a very wholesome, digestible, and nutritious food, but there are persons who are made ill by drinking it. They should avoid it. Some persons have to avoid strawberries. Such illness is ascribed to the reaction known as anaphylaxis (q.v.). Every man must learn from his own experience what food agrees with him and what does not.

Metabolism Experiments. As already stated, a knowledge of food and its uses in the body is obtained from studies of composition, digestibility, etc., and from complicated experiments, in some of which the balance of income and outgo of matter and energy is studied. The latter are called metabolism experiments, the balance of matter being measured in terms of nitrogen, or of nitrogen and carbon, and sometimes other elements also, and the balance of energy being measured in terms of heat. In

determining the balance of income and outgo of nitrogen, special attention is paid to the amounts of this constituent in food, urine, and feces. When the balance of carbon is also taken into account, a respiration apparatus is very convenient and almost necessary. This apparatus permits of the measurement and analysis of the respiratory products, since these contain a large part of the carbon (as carbon dioxide) excreted from the body. Various forms of respiration apparatus have been devised within the last 50 years, among the most important being those invented by Pettenkofer and Voit, in Munich. They consist of metal-walled chambers, large enough for the subject (sometimes a man, sometimes a dog, sheep, or other animal) to live in comfortably for several days, and are furnished with devices for pumping air through, and measuring and analyzing it as it enters and as it leaves the chamber. With such an apparatus it is possible not only to measure all the food and excreta, but also the materials given off from the lungs in the breath, and to make accurate determination of the matter entering and leaving the body. A still more elaborate apparatus, by which not only all the matter passing in and out of the body may be measured, but also all the heat given off from it, is called a respiration calorimeter—i.e., a machine for measuring both the respiratory products and the heat given off by the body. It is like the respiration apparatus, except that it is furnished with devices for measuring temperatures.

Several have been built in Europe and in the United States within the last 30 years, among the most successful being those by Professor Rubner and Professor Rosenthal in Germany, and the type devised by Professors Atwater and Rosa and their associates. The latter form, which represents a great advance on any previously devised, was elaborated at Wesleyan University in connection with the nutrition in-

measuring a ventilating current of air, for sampling and analyzing this air, for removing and measuring the heat given off within the chamber, and for passing food and other articles in and out of the chamber. The respiration chamber is furnished with a folding bed, chair, and table, with scales and with appliances for muscular work, and has a telephone connection with the outside. The ventilating air

TABLE III.—RESULTS OF DIETARY STUDIES IN THE UNITED STATES AND OTHER COUNTRIES

† The calorie is the unit used to measure heat. One calorie equals nearly 1.54 foot tons.

vestigations carried on under the auspices of the Office of Experiment Stations of the United States Department of Agriculture. This apparatus is now in the laboratories of the United States Department of Agriculture, where it is used for experimental purposes. It has been improved in many ways, particularly by the adoption of devices for automatically regulating and recording temperatures. Its main feature is a metal-walled chamber so constructed that heat cannot pass in or out through the walls, and fitted with devices for maintaining and

current is used over and over again, oxygen being supplied to replace that used by the subject, and the carbon dioxide and water of respired air being removed from the air current after it leaves and before it again enters the respiration chamber. The subject stays in the respiration chamber for a period varying from several hours to a number of days, during which time careful analyses and measurements are made of all material which enters the body in the food and of that which leaves it in the breath and excreta. Record is kept of the

energy given off from the body as heat and muscular work. The difference between the material taken into and that given off from the body is called the balance of matter and shows whether the body is gaining or losing material. The difference between the energy of the food taken and that of the excreta and energy given off from the body as heat and muscular work is the balance of energy, and if correctly estimated should equal the energy of the body material gained or lost. With such apparatus it is possible to learn much of the real nutritive value of foods, and what effect different conditions of nourishment will have on the human body. In one experiment, e.g., the subject might be kept quite at rest, and in another do a certain amount of muscular or mental work, with the same diet as before. Then, by comparing the results of the two, the use which the body makes of its food under the different conditions could be determined.

Dietaries and Dietary Standards. The information gained from a study of the composition and nutritive value of foods may be turned to practical account by using it in planning diets

results of dietary studies in like terms as regards the age and sex of the persons included, and the amount per man per day seem the most satisfactory basis of comparison.

Every one knows that the young child takes less food than the older, and that there are variations through adolescence to the period of full vigor and of old age. The numerous food investigations which have been carried on have furnished data for estimating the amounts consumed by children of different ages and by men and women at different periods of life, and general factors have been deduced which are shown in the table below, and which are used in calculating the results of dietary studies to the uniform basis "per man per day."

In this comparison a man in full vigor at moderate work has been selected as the unit for comparison and assigned the value 100. The greater or smaller requirements of men at more severe work, and of women and children, are shown by values greater or less than 100, as the case may be.

It is evident from the figures quoted that there is an increase in food consumption from

for different individuals or classes of individuals, or in estimating the true nutritive value of the food actually consumed by families or individuals. By comparing the results of many such investigations with the results of accurate physiological experimenting it is possible to learn about how much of each of the nutrients of common foods is needed by persons of different occupations and habits of life, and from this to compute standards representing the average requirements for food of such persons. The plan followed in making dietary studies is, briefly, as follows: Exact account is taken of all the food materials (1) on hand at the beginning of the study, (2) procured during the study, and (3) remaining at the end. The difference between the third and the sum of the first and second is taken as representing the amounts used. From the figures thus obtained the amount of the different food materials and the amount of the different nutrients furnished by them are calculated. Deducting from this the weights of the nutrients found in the kitchen and table refuse, the amounts actually consumed are obtained. Account is also taken of the meals eaten by different members of the family or groups studied and by visitors, if there are any. From the total food eaten by all the persons during the entire period the amount eaten per man per day may be calculated. In making these calculations due account is taken of the fact that women and children eat less than men performing the same amount of work.

It is a matter of convenience to record the

infancy until full vigor and that the food requirements again diminish in old age. The figures also show that during early youth and old age sex does not have a marked effect on food requirements, but from the time growth is complete until old age a woman requires less food than a man engaged in the same kind of work.

Other factors which have an influence on food requirements are climate, the bearing and nourishment of children, the pathological conditions due to diseases of different sorts, and various abnormal conditions.

As regards climate and seasons, the general conclusion reached is that more energy is required in cold than in warm weather, and it has been estimated that in winter the energy requirement is greater by 800 calories than in summer. Acute and chronic diseases and other abnormal conditions have a very decided effect on protein and energy requirements, and a knowledge of such conditions with reference to the kind and amount of food needed must form the basis of rational invalid dietetics, one of the most important subjects in the practice of medicine.

Just as some persons apparently normal in other respects cannot distinguish between certain colors, so others are apparently in perfect health and vigor whose food requirements differ markedly from those of the average normal individual. Such exceptions are interesting, but need not be considered in general discussions of protein and energy requirements.

Table III shows the average results of a large

number of dietary studies made in the United States and other countries with persons performing different amounts of muscular work and living under different conditions. As a result of the dietary studies which have been made and other data, certain dietary standards have been devised which, it is believed, may serve as useful guides for home management. The following table gives such data for a man at moderate muscular work, on the basis of food purchased, food eaten, and food digested.

TABLE IV.—DIETARY STANDARD FOR MAN IN FULL VIGOR AT MODERATE MUSCULAR WORK

	Protein	Energy
	Grams	Calories
Food as purchased.....	115	3,800
Food eaten.....	100	3,500
Food digested.....	95	3,200

The dietary standard expressed in terms of protein and energy only does not, of course, take account of the proportion of fats and carbohydrates present, and from the theoretical standpoint it is not necessary to do so, as it is immaterial which of these two classes of nutrients supplies the energy. From a practical standpoint, however, the proportion is of the greatest importance on account of its relation to the wholesomeness and palatability of the diet. The proportions which are usually consumed in the American diet are not far from 150 grams fat and 350 grams carbohydrates per 100 grams protein.

Higher dietary standards and lower ones (particularly with reference to protein) have been proposed, but none of them represent the extremes under which man has lived in apparent health and comfort. All the standards are rather attempts—based on evidence which has seemed to the purpose to justify the conclusion—at an optimum standard. The greatest variations in different standards are in the protein, and it seems fair to say that the matter will not be settled finally until more evidence is available. With respect to energy, experiments with the respiration calorimeter have shown that the value given in the standard quoted above is a reasonably close expression of the actual body requirement.

To be most useful, dietary standards should take into account the amount of ash constituents required by the body, for it is well known that mineral matters of different sorts are essential for use in forming bones and other body tissues for the repair of the body and for other purposes. A recent estimate of the mineral matter required per man per day calls for the following amounts:

ESTIMATED AMOUNT OF MINERAL MATTER
REQUIRED PER MAN PER DAY

Grams	Grams
Phosphoric acid (P_2O_5) 3-4	Calcium oxide...0.7 -1.0
Sulphuric acid (SO_3) 2-3.5	Magnesium oxide 0.3 -0.5
Potassium oxide.....2-3	Iron.....0.006-0.012
Sodium oxide.....4-6	Chlorine.....6 -8

Other mineral elements, as silica, iodine, and fluorine, are required, but apparently in much smaller quantities.

Nearly all the ordinary foods of both animal

and vegetable origin furnish some of these constituents. There is good reason to believe that with the ordinary mixed and reasonably generous diet the body demands for mineral matter may be met, and that when for any reason a deficiency of some ash constituent exists it may be supplied by using certain of the usual foods in greater proportion. For instance, a deficiency of calcium may be readily corrected by using larger amounts of milk and cheese, or of iron by using larger quantities of green vegetables, fruits, and the coarser milling products of the cereal grains.

It is not necessary that the food each day equal exactly the amount called for by the dietary standards. A deficiency one day is made good by an excess the next, and vice versa. Such dietary standards do not take into account differences in the nutritive value of proteins due to variations in the number and nature of the amino acids of which they are composed, nor do they take into account the vitamins or other essential substances present in minute amounts. Discussions based on such dietary standards assume that a reasonably varied, mixed diet will meet all requirements which would involve these factors. As knowledge accumulates the whole matter will no doubt be put on a more exact basis.

To learn whether any given diet conforms to the standard, the amount of nutrients and energy (or, what serves the same purpose, protein and energy) must be ascertained for a day or for a longer period by the method described above for making a dietary study. If the diet is found to be deficient in protein or in energy, food materials should be added which supply protein or are especially valuable as sources of energy (i.e., foods rich in fats and carbohydrates). If more protein or energy be provided than the standard demands, the food materials should be correspondingly diminished. In ordinary mixed diet, which seems to be the one best suited to man in health, the chief sources of protein are meat, fish, cheese, and milk, among animal foods, and the cereals and legumes among vegetable foods. About nine-tenths of the fat in the ordinary diet is obtained from the animal foods, while the vegetable foods furnish approximately nine-tenths of the carbohydrates.

Too much food is as bad as too little and occasions a waste of energy and strength in the body as well as a waste of nutritive material.

The palate revolts against a very simple and unvaried diet, and for this reason the nutrients are usually supplied from a variety of articles—some of animal, some of vegetable origin. With a varied diet it is also easier to secure the proper proportions of protein to fats, carbohydrates, ash constituents, and such substances as vitamins, or others needed at least in small quantity for normal nutrition.

Preparation of Food—Cooking. The cooking of food has much to do with its nutritive value. Many articles which, owing to their physical condition or other cause, are quite unfit for nourishment when raw are very nutritious when dressed for the table and cooked. It is also a matter of common experience that a well-cooked food is wholesome and appetizing, while the same material badly cooked is unpalatable. There are three chief purposes of cooking. The first is to change the physical condition so that the digestive juices can act upon the food more freely. Heating often

changes the structure of food substances very materially, so that they are more easily chewed and more readily and thoroughly digested. The second is to make food more appetizing by improving the appearance, the flavor, or both. Food which is attractive to the taste quickens the flow of saliva and other digestive juices, and thus digestion is aided. The third is to kill by heat any disease germs, parasites, or other dangerous organisms food may contain. This is often a very important matter and applies to both animal and vegetable foods. The fourth is to sterilize foods so that they will keep longer. The cooking of meats not only develops the pleasing taste and odor of extractives and that due to the browned fat and tissues, but it softens and loosens the connective tissues and thus makes the meat more tender. Extreme heat, however, tends to coagulate and harden the albuminoids of the lean portions and also weakens the flavor of extractives. If the heating is carried too far, a burned or charred product of bad flavor results. Meats lose weight in cooking. A small part of this is due to escape of meat juices and fat, but the chief part of the material lost is simply water. The nutritive value of a meat soup depends upon the substances which are dissolved out of the meat, bones, and gristle by the water. In ordinary meat broth these consist almost wholly of salts and extractives. The latter are very agreeable and often most useful as stimulants, but have little or no value as actual nutriment. The principles which underlie the cooking of fish are essentially the same as with meats. See FISH AS FOOD.

In many vegetables the valuable carbohydrates, chiefly microscopic starch grains, are contained in tiny cells with comparatively thick walls on which the digestive juices have little effect. The heat of cooking, especially with water, softens and often ruptures these walls and also makes the starch more soluble; without water it may also caramelize a portion of the carbohydrates and produce agreeable flavors in this and other ways.

In breads, cakes, pastry, and other foods prepared from flour, the aim is to make a palatable and lighter porous substance, more easily acted upon in the alimentary canal than the raw materials could be. Sometimes this is accomplished simply by means of water and heat. The heat changes part of the water in the dough into steam, which in trying to escape forces the particles of dough apart. The protein (gluten) of the flour stiffens about the tiny bubbles thus formed, and the mass remains porous even after the steam has escaped. More often, however, other things are used to "raise" the dough—such as yeast and baking powder. The baking powder gives off the gas carbon dioxide, and the yeast causes fermentation in the dough by which carbon dioxide is produced. This acts as the steam does, only much more powerfully. When beaten eggs are used, the albumen incloses air in bubbles, which expand, and the walls stiffen with the heat and thus render the food porous.

Pecuniary Economy of Food. Although the cost of food is the principal item in the living expenses of a large majority of the people, and although the physical welfare of all is so intimately connected with and dependent upon diet, very few of even the most intelligent have any ideas regarding the actual nutriment in the different food materials they use. In too many cases even those who try to economize know little

as to the combinations which are best fitted for their nourishment and have still less information as to the relation between the real nutritive value of different foods and their cost.

There are various ways of comparing food materials with respect to the relative cheapness or dearness of their nutritive ingredients. For instance, from the proportions of available nutrients and energy in different food materials given in Table II we may calculate the cost of the different nutrients per pound and of energy per 1000 calories in any given material for which the price per pound is known. Such figures show the relative economy of the various foods as sources of protein and sources of energy. Of course the amount of energy that would be obtained in a quantity of any given material sufficient to furnish a pound of protein would vary with the amounts of fats and carbohydrates accompanying the protein; and on the other hand, the quantities of the different materials that would furnish 1000 calories of energy would contain different amounts of protein. The figures for cost of protein leave the carbohydrates and fats out of account, and those for energy take no account of the protein. Hence the figures for either protein or energy alone give a very one-sided view of the relation between nutritive value and money cost. A better way of estimating the relative pecuniary economy of different foods is found in a comparison of the quantities of both nutrients and energy which can be obtained for a given sum, say 10 cents, at current prices. Such tables are often found in works of reference.

While in the case of certain foods as purchased, notably meats, some waste is unavoidable, the pecuniary loss can be diminished, both by buying cuts which are suited to the family or group and in which there is the least waste, and by utilizing, carefully, portions of what is usually classed as refuse. Much waste may be avoided by careful planning to provide a comfortable and appetizing meal in sufficient amount, but without excess. If strict economy is necessary, the dearer cuts of meat and the more expensive fruits and vegetables should be avoided. With reasonable care in cooking and serving, a pleasing and varied diet can be furnished at more moderate cost than when no attention is paid to such matters. It should not be forgotten that the real cheapness or dearness of a food material depends not only on its market price, but also on the cost of its digestible nutrients. It should always be remembered that "the ideal diet is that combination of foods which, while imposing the least burden on the body, supplies it with exactly sufficient material to meet its wants," and that any disregard of such a standard must inevitably prevent the best development of our powers.

In general, it may be said that, other things being equal, the cost of the daily food is determined by the proportion of the total expended for such staple articles as bread, meat, butter, eggs, and common vegetables, to the expenditure for accessory foods, such as expensive fruit, out-of-season vegetables, fancy sweets, and the like, which, as ordinarily used, contribute more to the attractiveness of the diet than they do to its nutritive value.

It is in the combination, with due reference to economy, of staple articles, many of them lacking in distinctive flavor, with foods and dishes which possess flavor in marked degree,

that one of the greatest opportunities for skillful management in the household occurs. Careful buying, good cooking, and careful serving to suit the demands of individual appetites in the family so that little is left on plates to be thrown away are important factors in economical living, as is also the careful use of all material left over in the kitchen or on the table after the family has been served.

An opportunity may be found for lessening the expenses in many families by cutting down the waste, particularly in such foods as meat, butter, and others which are comparatively expensive.

Hygienic Considerations. Scrupulous neatness should always be observed in keeping, handling, and serving food. If ever cleanliness is desirable, it must be in the things we eat, and every care should be taken to insure it for the sake of health as well as of decency. Cleanliness in this connection means, not only absence of visible dirt, from worms and other parasites, but freedom also from undesirable bacteria and other minute organisms. If food, raw or cooked, be kept in dirty places, peddled from dirty carts, prepared in dirty rooms and in dirty dishes, or exposed to foul air, or to flies and other insects, disease germs and other offensive and dangerous substances can easily get in. Food and drink may, in fact, be very dangerous purveyors of disease. The human hand soiled with feces or urine is very often the agent which conveys the "germs" to the food. Experiments have clearly shown that fruits, vegetables, and other foods may readily acquire undesirable or dangerous bacteria if exposed to street dust. The bacteria of typhoid fever sometimes find their way into drinking water; those of typhoid and scarlet fevers and diphtheria into milk. Thus sickness and death are brought to large numbers of people. Oysters which are taken from the salt water where they grow, and "floated" for a short time in brackish water near the mouth of a stream, have been known to be affected by typhoid-fever germs brought into the stream by the sewage from houses where the dejections from patients had been thrown into the drains. Celery or lettuce has been found to convey typhoid fever from having grown in soil containing typhoid germs. Insects may, and often do, carry filth and disease germs to food—and none more often than flies.

Food materials may also contain parasites, like tapeworms in beef, pork, and mutton, and trichine in pork, which are often injurious and sometimes deadly in their effect. This danger is not confined to animal foods. Vegetables and fruits may be contaminated with eggs of numerous parasites from fertilizers used in growing them. Raw fruit and vegetables should always be very thoroughly washed before serving if there is any doubt as to their cleanliness. If the food is sufficiently heated in cooking, all organisms are killed. Sometimes food undergoes decomposition in which it is claimed injurious chemical compounds, so-called ptomaines, are formed. More commonly the illness is due to the accidental contamination of the food with disease-producing microorganisms which grow rapidly in it.

Food inspection is maintained in most States, and after several years of efforts a national pure-food law was passed by Congress in June, 1906. This law prohibits the shipment from one State to another, or to foreign coun-

tries, of foods, condiments, drugs, confectionery, liquors, etc., which are adulterated or misbranded. The law is comprehensive and is specific in defining what constitutes adulteration and misbranding. Its execution is largely placed in the hands of the United States Department of Agriculture, which is directed to maintain an inspection. Penalties are provided for infractions of the law, consisting of fine, imprisonment, or both. Many of the States and many other countries have enacted such pure-food legislation also.

FOOD IN PLANTS is generally spoken of as serving two purposes, by furnishing (a) building material and (b) energy. The latter is rendered available for work in the organism by respiration or fermentation (q.v.) of the food. Some authors, use food in its application to green plants to include only organic compounds, mainly carbohydrates, fats, and proteins, and do not consider the inorganic substances, carbon dioxide, water, and various necessary salts, out of which these are synthesized, under the term. Others use the term in a wider sense, including under it the inorganic nutrients mentioned above as well as the organic substances. Still others prefer to avoid the term in connection with plants because of its indefiniteness. It would seem better to use the term in the narrower sense and "nutrients" as the broader term. Even in green plants, however, such a restriction of the term meets difficulty. For example, we

know little about how the essential metals (obtained in the form of salts) enter into the composition of the plant body, except magnesium, which is a part of the chlorophyll molecule.

Of the nonchlorophyllous plants, many thrive on carbohydrates along with various inorganic salts. These can synthesize their fats from carbohydrates and their proteins from carbohydrates and the necessary salts. Others demand the nitrogen as well as the carbon in the form of complex organic compounds. The pathogenic bacteria often demand nitrogen in the form of peptones or proteins.

There are a number of colorless autotrophic forms (sulphur, nitrite, nitrate, and other bacteria) which oxidize inorganic substances (hydrogen sulphide, sulphur, ammonia, nitrite, etc.) as a source of energy, both for synthesizing organic materials, that make up their bodies, from carbon dioxide and water along with the necessary salts, and for carrying on other physiological processes. In these forms, at least, inorganic materials through direct oxidation fill the second need of food, viz., source of energy.

FOOD, PRESERVATION OF. Most of the processes of preserving food which are practiced to-day were known long before the reasons for them were understood. It was recognized that molds grew, that liquids fermented, and that other similar changes took place, and they were explained on the theory of spontaneous generation of life. In 1860 Pasteur was awarded a prize for his work overthrowing the theory of spontaneous generation. In this and later work he showed that fermentative, putrefactive, and other changes which took place when foodstuffs or other material were kept exposed to air, were due to the presence and growth of minute forms of life, and that if these forms of life were once destroyed the changes would not take place unless they were again introduced. The great development of bacteriology, the subject of most importance in relation to food preservation, is the outgrowth of Pasteur's investigations.

Preservation of food is of two general sorts, viz., temporary and long continued. *Temporary preservation* is secured by protecting foods from loss of moisture (drying or wilting); from being too moist; from losing flavor or losing color (fading); from contact with dirt, dust, insects and vermin; and so on. It is accomplished by keeping the foods cool in a refrigerator or in earlier times in the spring house or suspended in a covered bucket or pail hung in the well; keeping foods moist by storing them, as, e.g., bread or cake in a special box or jar; or by wrapping green vegetables in a damp cloth and, in general, by suitably protecting them, keeping them from dust, insects, etc., by the use of the usual household utensils, containers, cupboards, storerooms, etc. Protection from molds, ferments, and other microorganisms is also important and usually accomplished fairly well for the short period by taking the precautions referred to.

Long-continued preservation involves protection of foodstuffs from the action of yeasts, molds, and bacteria, as well as from the atmosphere, and often from light, from insects, vermin, etc., and from mechanical losses. This presupposes suitable protective coverings and containers, but the principal point involved is the

preventing of the growth of the microscopic forms of life referred to. (See BACTERIA.) These minute organisms, like other forms of life, require for their growth suitable nutritive substances, and moisture as well as proper light and heat conditions. They are also influenced by the presence or absence of oxygen and by the osmotic pressure of the medium in which they are grown. The influence of these factors varies with the different types. The principal preserving processes employed to bring about the desired hindrance or prevention of the growth of microorganisms which cause fermentative and putrefactive and other changes in food are destruction of any already present and preventing others from reaching the foods. The processes followed are the removal of moisture (desiccation, drying, and evaporating); exclusion of air (vacuum, immersion in fat or oil, covering with fat, etc.); low temperature (cooling and refrigeration); high temperature (pasteurization and sterilization, as in canning, tinning, bottling, etc.); the use of preservatives (household—salt, sugar, wood smoke, spice, vinegar, alcohol, e.g., brandy, etc.; chemical—formalin, benzoic acid, etc.); and the employment of fermentative, putrefactive, bacterial, and enzymic action (souring and special fermentations of milk, cheese ripening, fermentation with addition of salt as in sauerkraut making, etc.) of a desirable character, which itself prevents an undesirable kind from taking place.

For the successful carrying out of the various operations some basal facts must be realized—e.g., that the various parasites and saprophytes which cause deterioration and decay have maximum, minimum, and optimum growth temperatures; that many of the microorganisms occur in both vegetative and spore conditions; and that these differ with respect to the thermal death point. The thermal death point is also influenced by the acid or alkaline reaction of the media, which explains, e.g., the ease of canning fruits which are acid as compared with the difficulty experienced in the home canning of vegetables which are usually nonacid. The protective action upon the thermal death point of colloid solution is also important. As an illustration, milk, a colloidal solution, is relatively difficult to sterilize. The influence of osmotic pressure upon growth of microorganisms is shown, e.g., by a heavy sugar sirup which acts as a preservative because of suitable differences in density. In a similar way condensed milk is too dense for the ready growth of microorganisms causing decay. Food preservation must also take into account in general the widespread distribution of microorganisms in the atmosphere, etc., and their general relation to dust and dirt.

Drying or desiccation is probably the oldest, as it is the simplest method of preserving grains, fruits, vegetables, and even meats from decay. Often this was combined with parching, as in the parched oatmeal of the Highlanders or the parched corn of the American Indians. During the nineteenth century this method of preserving foods was developed into a great commercial enterprise by the application of scientific principles. A great advance was made in the desiccation or dehydration by the introduction of methods which permitted rapid drying at a comparatively low temperature in vacuum, or partial vacuum which permits the removal

of water without as great changes in the flavor and color as were brought about by the long-continued drying of the older method. To insure the best quality when used, most dried or desiccated fruits and vegetables should be immersed in water before they are cooked in order that they may slowly regain their original moisture content. Evaporated or condensed milks are usually mixed with water before using, while milk powders, egg powders, and similar things are handled in various ways to suit different culinary requirements, as are also dried fish and dried meats.

The exclusion of air by immersion in oil or fat is a common method of preservation, an illustration being the covering of potted meats with a layer of fat. A familiar household application is the pouring of a spoonful of olive oil on top of the fruit in an open can, bottle of olives, or jar of pickles. A similar result is obtained when melted paraffine is poured over the top of jelly or preserves, which hardens to an impervious layer and so hinders or prevents the growth of molds.

Preservation by low temperature has developed very greatly in recent years, and *cold storage* has become an enterprise of great importance. Favorable temperatures for holding various food products in good condition have been learned by experiment and observation, as has also the maximum time which various foods may be held without deterioration characterized by marked loss of quality, for it must be remembered that while cold storage greatly retards, it does not in many cases entirely prevent the changes brought about by the ferments or enzymes normally present in plant and animal tissues, or those due to the bacteria and other microorganisms which are almost always accidentally present. See REFRIGERATION; PACKING INDUSTRY.

Preservation by high temperature has found its greatest application in pasteurization and in sterilization. The time of heating as well as the temperature is important. In general, the higher the temperature, the shorter the time required. Pasteurization involves heating at a lower temperature than that of boiling water; in practice in the pasteurization of milk heating to about 145° F. for 30 to 45 minutes. Sterilization is very often accomplished by heating at 212° or at a higher temperature for a shorter period than is found necessary at the temperature of boiling water. Higher temperatures are maintained by heating in a water bath made dense, as, e.g., by the addition of common salt or in process kettles involving the use of dry steam or superheated steam. It has also been found that fractional sterilization is often a desirable process, i.e., the repeated sterilization for a short period at intervals of a day or two. See STERILIZED FOOD.

Canning (tinning or bottling) and **preserving**. These terms are sometimes used as synonyms and sometimes with different meanings. In the case of fruits canned (tinned or bottled) goods usually contain a smaller portion of sugar to pulp and juice than preserves or marmalades. Jellies are made from sugar and juice without pulp. Canned and preserved meat, dairy, and fish products have distinctive names which vary more or less in English-speaking countries.

The process of hermetically sealing food to preserve it for future use was discovered in

1795 by a Frenchman named Nicholas Appert. Fourteen years later Napoleon gave him a prize of 12,000 francs for his invention. He continued his researches through life, spending all his money upon them, and, like many other inventors, died alone, in poverty and neglect. In 1810 an English patent was taken out for Appert's process, from which, however, the latter derived no benefit. From England the knowledge of the process was soon brought to America. Lobsters and salmon were the first goods canned commercially in America, but in 1825 fruits and vegetables were also canned.

Glass jars were at first used, but their general use was soon abandoned on account of their perishability, bulkiness, and expensiveness, and in 1823 Thomas Kensett secured a patent on the use of tin cans for this purpose, and this material has since been very commonly employed. Earthenware jars have always been popular for some kinds of goods, particularly jams and other thick fruit preserves, and for potted meats, cheese, etc.

In the modern canning factory the goods are immediately sorted and placed in the cans, and the caps soldered on. In each cap there is a hole for the escape of gas and steam during the cooking process. The cans are then placed in a steel boiler, the cover of which is bolted down, and steam turned in, which sterilizes the contents by heating to the proper temperature under pressure. They are then hermetically sealed by placing a drop of solder on each vent hole and are ready for shipment. Not only raw foods, but a large variety of made dishes, as soups, sauces, and jams, are put up in this way.

The canning of fish requires greater care than that of fruit and vegetables, because fish decays so much more rapidly. The salmon canneries of the Pacific are usually located on the water's edge. The fish immediately upon receipt is subjected to an ice-cold bath and after being dressed is again washed. It is cut up by machinery into pieces the length of the can and is then subjected to such intense heat that not only the fish but the bones are cooked so that they will crumble. The cans are tightly soldered for the first cooking. They are then tested by the process known as "blowing" or "venting," which consists in making a small perforation in each can to permit the escape of steam. The can is then placed in another steam-heated retort for the final cooking, after which it is given a lye bath to remove grease. After cooling the cans are lacquered and labeled, ready for market.

The canning of oysters has been encouraged by various improvements.

The objection has been urged against the use of tin cans that the natural acids of fruits, vegetables, and meats act upon the tin and solder in such a way as to form metallic salts or metallic compounds that are injurious to health. It has been demonstrated that the amount of tin passing into solution depends upon the acidity of the material canned, the age of the sample, and the quality of the plate. Heavy plated tin resists the action of acid solutions better than the light plates frequently employed. Recent experiments indicate the advantage of coating the inside of tin cans with a lacquer or varnish.

Canning and preserving are very commonly combined with the use of household preservatives, as spice and vinegar in case of fruits;

salt in case of vegetables; salt, spice, and vinegar in pickle making; and salt, spice, etc., in canning meats and meat products. Commercial preservatives, as benzoic acid, benzoate of soda, formalin, and others, have also been so extensively used in canning and preserving and in other ways that the matter has in most countries been regulated by legislative enactment. See ADULTERATION.

Most of the methods of long-continued preserving of foods are practiced on a household as well as a commercial scale. The processes followed in each case are the same, though the equipment and technique differ, as is natural, since household methods involve small quantities as compared with the enormous amounts handled in commercial food preserving.

Statistics of the Canning Industry. With respect to the extent of the canning and preserving industry of the United States, the latest available census report (1913) states that in 1909 the total number of establishments engaged in this business in the United States was 3767; the capital involved, \$119,207,127. The enterprise gave employment on an average to 71,972 persons, of whom over two-thirds were wage earners, and paid out \$26,945,466 in salaries. The establishments considered were those whose chief products are canned and preserved fruits and vegetables, including dried and packed fruits; those whose chief products are canned and cured fish, including pickled, smoked, and dried goods; those whose chief products are canned oysters and clams; and those whose chief products are pickles, preserves, jellies, sauces, etc. The combined cost of the materials used in all four branches of the industry in 1909 was \$101,823,059, the value added by the manufacturing process, \$55,278,000, and the value of the output, \$157,101,000. This figure, however, did not include meats canned in general packing and slaughtering houses.

ing the canning industry, consult Hune, "Canning and Preserving," in *Thirteenth Census of the United States, "Manufactures,"* vol. x, part iii (Washington, 1913).

FOOL. See COURT FOOL.

FOOLS, FEAST OF. See FEAST OF FOOLS.

FOOL'S ERRAND, A. A novel of the South in the Reconstruction period, by Albion W. Tourgée (1879).

FOOL'S PARADISE (Lat. *limbus fatuorum*). That division of *limbus* (q.v.) in which the souls of fools, idiots, and lunatics, who are not responsible for their sins nor yet deserving of heaven, await the Resurrection. As commonly used, the expression denotes a state of insecure joys or false hopes.

FOOL'S PARSLEY. An umbelliferous weed, very common in gardens and fields of Europe, and introduced into the United States from New England to Minnesota. The only species, *Athusa cynapium*, is a poisonous plant with properties similar to those of the hemlock and resembles parsley in its manner of growth and foliage. It is frequently mistaken for parsley and is the cause of serious accidents.

FOOL'S REVENGE, THE. A tragedy by Tom Taylor, produced at the Queen's Theatre, London, in 1869. It was taken bodily from Hugo's *Le roi s'amuse*.

FOOT. See WEIGHTS AND MEASURES.

FOOT. See ORGAN.

FOOT. See VERSIFICATION.

FOOT. In describing the structure of the foot we begin with the bones which occur in it. In man these are 26 in number and are arranged in three natural groups—viz., the tarsal bones, corresponding to the carpal bones of the hand, which are the hindmost; the metatarsal bones, which occupy the middle portion; and the phalanges of the toes anteriorly. The tarsal bones, seven in number, are short and thick and form the heel and the hinder part of the instep. The uppermost is called the *astragalus*, from its supposed resemblance to the dice used by the Romans. Above it is articulated or jointed with the two bones of the leg, the *tibia* and *fibula*, and through these bones the whole weight of the body is thrown upon the two *astragali*. Behind, it is connected with and rests upon the *os calcis*, or heel bone, which is the largest bone of the foot. Immediately in front of it is the *scaphoid* (boatlike) bone. In front of the scaphoid bone are the three *cuneiform* (wedge-shaped) bones; and on the outer side of the cuneiform bones and in front of the *os calcis* is the *cuboid* bone. The front row of tarsal bones is composed of the three cuneiform bones on the inner side of the foot and of the cuboid bone externally. There are five metatarsal bones passing forward, one for each toe. Each cuneiform bone is connected with one, and the cuboid bone with two, of these metatarsal bones. Behind they are close together, but as they run forward they diverge slightly from one another, and their anterior ends rest upon the ground and form the *balls* of the toes. They constitute the fore part of the instep. The remaining bones are those of the toes and are named the *phalanges*, each toe having three of these bones, excepting the great toe, which has only two.

The instep is composed of the seven tarsal and the five metatarsal bones, which are so arranged and connected as to form an arch from the extremity of the heel bone to the balls of the toes.

This is called the plantar arch, from *planta*, the sole of the foot. The astragalus forms the summit or keystone of this arch and transmits the weight which it receives posteriorly to the heel and anteriorly to the balls of the toes. The arrangement of the fibres and laminae in the interior of the bones is such that the greater number of them in each bone follow the directions of the two pillars of the arch and thus give the greatest strength to the bones in the directions in which it is most required. There

DORSAL SURFACE OF LEFT FOOT.

is also an arch from side to side in the foot, springing from the cuboid on the outside to the inner cuneiform on the inside. See FOOT, COMPARATIVE ANATOMY OF.

The bones, where they articulate with one another, are covered with a tolerably thick layer of highly elastic cartilage, and by this means, together with the very slight movements of which each bone is capable, a degree of elasticity is given to the foot, and consequently to the step, which would be altogether wanting if the plantar arch were composed of one single mass of bone. This elasticity is far greater in the anterior pillar of the arch, which is composed of five comparatively long bones sloping gradually to the ground, than in the posterior pillar, which is short, narrow, and composed of a single bone, which descends almost vertically from the ankle to the ground. Hence, in jumping from a height we always endeavor to alight upon the balls of the toes and thus break the shock which we should feel if by accident we descended upon the heels.

The ligaments which unite these bones to one another, and by which the movements of each bone upon the others are limited, are very numerous. Two of the most important of these may be mentioned. One, the *plantar*, or *long calcaneocuboid ligament*, of great strength, passes from the undersurface of the os calcis,

near its extremity, forward to the bases of the second, third, and fourth metatarsal bones. It extends between the lowest points of the two pillars of the arch, holding them in their places, and preventing their being thrust asunder when pressure is made upon the key bone. It converts the groove on the undersurface of the cuboid bone into a canal for the passage of the tendon of the *peroneus longus* muscle. Another strong ligament passes from the under and fore part of the os calcis to the outer side of the scaphoid bone. This is the *superior calcaneoscaphoid ligament*. The *interosseus*, or *internal calcaneocuboid ligament*, directly connects the os calcis and the cuboid bones. It is blended at its origin with the *superior calcaneoscaphoid ligament*; and by separating in front they form the Y ligament. The Y ligament underlies and supports the round head of the astragalus and has to bear a great deal of the weight which is transmitted to that bone from the leg. It possesses a quality which the ligament just described, and most ligaments, have not, viz., elasticity. This is very important, for it allows the head of the key bone to descend a little when pressure is made upon it and forces it up again when the pressure is removed, and so gives very material assistance to the other provisions for preventing jars and for giving ease and elasticity to the step.

The spot over which this ligament extends is the weakest in the foot, the astragalus being there unsupported by any bones; additional support is, however, afforded when it is most required by the tendon of a strong muscle, the *posterior tibial*, which passes from the back of the tibia (the chief bone of the leg) round the inner side of the ankle, to be inserted into the lower part of the inner surface of the scaphoid bone. It not infrequently happens that the astragalus, from being either insufficiently supported or overweighted, descends slightly below its proper level, causing a lowering of the arch and a flattening of the sole of the foot. The defect, when decided, is termed "flat foot"; in extreme cases the bones may descend to such an extent as to render the inner side of the foot convex instead of concave. There are two periods of life at which flat foot is especially liable to occur: (1) in infancy, if the child be put upon its feet before the bones and ligaments, especially the latter, are strong enough to bear its weight; and (2) about the age of 14—a period at which growth is very quick, and the body consequently attains a considerable and rapid augmentation of weight. For other deformities of the foot, see CLUBFOOT.

We now come to the movements of the foot upon the leg. We see here a striking combination of variety of movement with general security. This combination is effected by the harmonious action of three joints, each of which acts in a direction different from the others. The first of these joints is the ankle joint, which is formed by the bones of the leg—the tibia and fibula—above and the astragalus below. By this joint the foot is bent or straightened on the leg. The second joint is between the astragalus and the heel bone, and it permits the foot to be rolled inward or outward; while the third joint is between the first and second rows of tarsal bones—viz., between the astragalus and heel bone behind, and the scaphoid and cuboid bones in front—and allows the degree of curvature of the plantar arch to be increased or diminished

within certain limits. The following is the order in which the movements of these three joints occur: the raising of the *heel* (by the first joint) is accompanied by a rolling of the foot inward (by the second joint), and by an increased *flexure* of the plantar arch (by the third joint); and the raising of the *toes* is accompanied by a rolling of the foot outward and a *straightening* of the sole.

Each of the three movements we have indicated is effected by special groups of muscles. The first series of movements is mainly effected by three muscles, viz.: (1) *the muscles of the calf*, attached above to the bones of the thigh and leg, and below by the *tendo Achillis* to the

EFFECT OF MUSCULAR ACTION IN THROWING UP THE ARCH.

heel bone; (2) *the posterior tibial*, attached above to the tibia, and below by its tendon to the scaphoid bone; and (3) *the peroneus brevis*, attached above to the fibula, and below by its tendon to the outer metatarsal bone. The calf muscles, whose tendon is inserted into the heel bone, are large and very powerful, for in raising the heel they have to raise the weight of the body. The other two muscles, the posterior tibial and the short peroneal, turn round the inner and outer ankle respectively, and are inserted into the inner and the outer edges of the instep—the former being attached to the scaphoid, and the latter to the outer metatarsal bone. They not only assist in raising the ankle, but support it laterally. The muscle whose tendon is on the inner side of the foot (the posterior tibial) effects the two move-

ARCH OF THE FOOT IN ORDINARY STANDING POSITION.

ments which are associated with the raising of the heel bone, viz., the turning of the foot inward and the increased flexure of the arch. The second series of movements—the raising of the toes, the turning of the foot outward, and the straightening of the sole—are

effected by two muscles, the *anterior tibial* and the *third peroneus*, whose tendons pass, one in front of the inner ankle, and the other in front of the outer ankle, to the corresponding edges of the instep, and are inserted into the internal cuneiform and the outer metatarsal bones. The muscles are direct flexors of the tarsus upon the leg, the former raising the inner and the latter the outer border of the foot.

Another point in the anatomy of the foot that requires notice is the mode of union of the metatarsal with the tarsal bones. In these joints in the fourth and fifth toes a slight revolving motion can take place, which probably enables the outer metatarsals to adapt themselves to inequalities of the ground, and to equalize the distribution of the weight which is thrown upon the foot; while in the correspond-

ing joints of the three inner toes scarcely any motion can occur—a provision by which additional strength is given to the inner side of the foot, upon which the weight of the body most directly falls.

The skin of the sole is very tough and strong; and intervening between it and the bones and long plantar ligament is a thick pad of fat, which acts the part of an air or water cushion in defending the adjacent parts from injurious pressure and in deadening the jars and shocks that would otherwise be felt in leaping, etc.

Consult Gray, *Anatomy* (Philadelphia, 1913), and Nutt, *Diseases and Deformities of the Foot* (New York, 1913).

FOOT, COMPARATIVE ANATOMY OF THE. As locomotor appendages, so called, feet occur in echinoderms, mollusks, and arthropods among invertebrates, but they are not in any way homologous with the feet of the higher vertebrates. Among echinoderms the name "foot" is given to any appendage of the ambulacral system which terminates in a sucker, and in the case of starfishes it is extended to any of the appendages lying in the ambulacral groove. These echinoderm feet are often, but by no means always, used for locomotion. Mollusks possess a very muscular and usually largely developed organ, primarily concerned with locomotion, known as the foot; it is flat or concave in the chitons and gastropods and covers the ventral side of the body; in lamellibranchs it is also ventral in position, but is wedge-shaped and laterally compressed; in cephalopods it is anterior in position, surrounding the mouth, and is divided up into a siphon, placed posteriorly, and a number of outgrowths known as tentacles or arms. Among cephalopods the chief function of the arms is for capturing prey, locomotion being provided for in other ways, chiefly by means of the siphon, which is formed by the union of two epipodial folds. The "feet" of arthropods show a very great variety of form, due chiefly to the variety of functions which they perform. In most cases it is practically impossible to distinguish between leg and foot, the latter consisting merely of the terminal joint or joints of the former. In many insects, however, the terminal part of the leg is so placed, with reference to the other joints, when in use, that it has both the appearance and function of a foot.

Amphibians and Reptiles. Passing over the nonhomologous fins of fishes, we may first mention the foot of the Urodela, the short-legged amphibians. As in all vertebrates, the feet here are the termination of the hind limbs, and their skeleton consists of two or three parts, according to whether we include the ankle bones or not. Most distal of all are the phalanges of the digits or toes, then follow the metatarsals, and most proximal are the tarsals. In the Urodela the feet are supplied with five digits in most cases, but some have only four, and *Proteus* has only two; the digits lack nails or claws; the number of phalanges differs in the various digits as well as in various species. The metatarsals are of the same number as the toes and appear like their proximal joint. The tarsals are a group of nine bones, of which one, the centrale, occupies a middle position; distal to it are five others of approximately uniform size, called tarsales; proximal to the centrale are three bones, of which the inner is the tibiale, the outer the fibulare, and the middle one the intermedium. In the Anura (frogs, toads, etc.) the

foot is very much larger, and the toes, five with no nails, are broadly webbed; phalanges and metatarsals are greatly elongated, as are also two of the tarsal bones, which are known as the astragalus and the calcaneum; the former is the tibiale, with which the intermedium has fused, while the latter is the fibulare. The *Chelonia* (turtles, etc.) have five digits, but in the marine forms the toes are more or less firmly united together by the integument, thus forming paddles useful in swimming. Some or all of the digits of *Chelonia* bear nails or claws. The phalanges and metatarsals are stout and short, except in the marine forms, where they are elongated and flattened. The fifth metatarsal has the appearance of being bent in the middle. The tarsal bones undergo various fusions, so that their number and arrangement differ in different genera. The tibiale and intermedium are generally united into an astragalus, which in some cases includes the centrale also, and in one genus (*Emys*) even the fibulare, thus making a single bone of the whole proximal series. The two outer tarsals are fused to form the cuboid. Lizards usually have five digits, two, three, four, five, with four phalanges respectively, beginning at the inner side; the fifth metatarsal is bent as in the turtles, and is perhaps fused with the fifth tarsale, in which case the ankle joint would come in part between the two rows of tarsal bones, which is the condition of the ankle in birds. In lizards we find an astragalus and calcaneum proximally and a cuboid distally, with sometimes one or two more of the tarsales. Feet are entirely lacking in snakes, unless the spur on each side of the body near the vent in the boas and pythons be regarded as such. Crocodiles have only four toes, though an examination of the skeleton reveals a rudimentary fifth metatarsal; the four digits have respectively two, three, four, and four phalanges, and only the first three have claws. Only four tarsal bones are present, of which the two distal ones are small, while the two proximal, called astragalus and calcaneum, are large; the latter bears a prominent calcaneal process projecting posteriorly, which forms a heel to the foot—the first occurrence of such a thing in the animal kingdom.

Birds. Among birds the feet are so profoundly modified by the various uses to which they are put that we find a very great variety of external form, but the skeletal structure shows considerable uniformity. The number of digits is usually four, not rarely three, and in the ostrich only two; the fifth toe is the one always missing, the first occasionally, and in the ostrich the second also; the phalanges are almost always two, three, four, and five, or rarely, two, three, four, and three, or in swifts, two, three, three, and three. The metatarsals are more or less completely fused into a single bone, the upper end of which is fully fused with the distal row of tarsal bones. The proximal tarsal bones are fused with the lower end of the tibia, so that the ankle joint is actually between the two series of tarsal bones. In the foot of a bird, therefore, what is usually termed the "heel" is simply the base of the digits; the so-called "tarsus" (see BIRD) is really a tarsometatarsus, and the "tibia" is a tibiotarsus. The foot of a bird is usually free from feathers and is generally covered with scales, and the digits terminate in straight or more or less hooked claws. In some birds, however, especially among the

grouse and the birds of prey, the feet are feathered (at least in front) to the base of the toes, and in ptarmigans even to the claws.

Mammals. Among mammals there is perhaps even greater variety in the form and structure of the foot than among birds, but the foot of mammals is usually very similar to the hand, except in the highest forms. In the orders Sirenia and Cetacea there is no foot whatever, and among the aquatic Carnivora (seals, etc.) it is modified to form a sort of flipper of great use in swimming; this is accomplished by the lengthening of the first and fifth digits, the great reduction of the heel, and the greater or less union of the leg with the tail and posterior part of the body. The number of functional digits in mammals varies from one to five, but frequently, where the number is below five, rudimentary digits are present. The digits terminate either in claws, nails, or hoofs, according to the habits of the animal; the number of phalanges is remarkably constant—in the first digit two, and three in each of the remaining four. In the Ungulata the metatarsals are often fused to form a long tubular bone, the "cannon bone." The tarsus of mammals contains from six to eight bones, according to the amount of fusion; the intermedium is distinct only in marsupials, in the Monodelphia being fused with the tibiale to form the astragalus; the fourth and fifth tarsals fuse into a single bone known as the cuboid; the centrale is called the navicular, and the calcaneum is called the pisiform bone; the other tarsals are known as cuneiform bones, and the inner and second one sometimes fuse to form a single bone. Lack of space forbids any discussion of the general appearance of the feet and their special uses in mammals, but it may be remarked that if the whole sole of the foot is applied to the ground the animal is called "plantigrade," like man; if only the toes form the supporting portion of the foot, the animal is "digitigrade"; and if only the distal phalanx serves for support (as in the horse), the creature is "unguligrade."

FOOT, KATHERINE (1852–). An American zoölogist. She was born at Geneva, N. Y., and was educated privately. She became known for her work in cytology, her special field being the spermatogenesis and oögenesis of Hemiptera and the maturation and fertilization of the egg of *Allolobophora fetida*.

FOOT, SOLOMON (1802–66). An American lawyer and legislator. He was born in Cornwall, Vt., graduated at Middlebury College in 1826, and was professor of natural philosophy in the Vermont Academy of Medicine from 1828 to 1831, when he was admitted to the bar. After 1833 he served several terms in the State Legislature, for three years (1836, 1838, and 1847) as Speaker of the House; and he was one of the Representatives of his State in Congress from 1843 to 1847, and from 1851 until his death was a member of the United States Senate, serving as president pro tempore in 1861–63. At first a Whig, he joined the Republican party at the time of its formation in 1856.

FOOTA-JALLON, fōō'tā'zhā'lōn'. See FUTA-JALLON.

FOOT-AND-MOUTH DISEASE, or APHTHOUS FEVER. A virulent infectious disease, characterized clinically by a condition of fever followed by eruptions on the integument especially of the mouth and feet. Since the middle of the eighteenth century outbreaks of

an epizootic form have been frequently recorded among cattle, which, like pigs, are especially subject to it. It also occurs in sheep, goats, and other even-toed ungulates. Man is frequently affected. In European countries, where the disease usually prevails and causes great losses, the outbreaks have usually spread from Asia. Africa has also been visited. The United States has been visited by several outbreaks, all of which have been promptly eradicated by the National Department of Agriculture in coöperation with the States in which the outbreaks have occurred.

The disease may appear under a mild or a grave form. In the mild form symptoms of fever and general lassitude are observed. Bladder-like eruptions appear, especially on the mucous membrane of the mouth, between the hoofs, and on the mammary gland. The last-named location is most frequently attacked during the secretory condition of the gland. Mammitis is a frequent complication of the disease. The mortality from this form of the disease in cattle is usually from 2 to 50 for each 1000 cases. In the grave form of the disease eruptions occur on internal mucous surfaces of the digestive or respiratory tract. The symptoms in such cases are those of acute bronchitis, pneumonia, or enteritis, according to the part which is affected. The mortality in this form varies from 15 to 20 per cent. In sheep the eruptions on the feet are usually more serious and persist for a longer time. In sucking lambs the disease assumes the intestinal form and is especially fatal. The disease spreads rapidly among animals confined in the same stable. Infection may be produced by the eruptions on the feet. Infected water is another common means of dissemination. The virus of the disease may gain entrance to the organism through the uninjured mucous membranes of the mouth, respiratory passages, or the alimentary tract. The pathogenic organism of this disease has recently been isolated and termed *Cytoryctes aphtharum*. The period of incubation after infection by natural methods is from two to six days. The virus is readily destroyed by desiccation or by exposure to air and sunlight. It possesses a weak resisting power to antiseptics such as carbolic acid and formaldehyde. Inoculation with serum from animals which have recovered from the disease does not confer immunity. Attempts to work out a method of immunization which would be sufficiently effective and at the same time without danger have so far given only partially satisfactory results. No medicament has been found to have a specific action on the development of the disease. The mucous surfaces upon which eruptions occur may be washed with antiseptic solutions, and other symptoms may be combated as they appear. The chief reliance should be placed on proper sanitary measures. Diseased animals should be immediately shot and buried or burned, and infected stables should be thoroughly disinfected. In Europe, and other periodically visited countries, however, such drastic measures cannot be resorted to.

The meat of apthous animals is not considered dangerous as food for man. The milk of such animals is, however, highly infectious. The disease may also be contracted from eating infected butter and cheese.

FOOTA TORO, fōō'tá tō'rō. See FUTA TORO.

FOOTBALL. An outdoor game played by opposing teams with an inflated ball, the principal object on the part of one team being to force the ball across the goal of the other. Football—or, as it was called in early English times, camp ball, camping, or hurling—is a sport of great antiquity. The ancient Greeks played a form of the game which they called *harpaston*. The Romans played a similar game which they called by its Grecian name, slightly Latinized into *harpastum*. Julius Pollux, writing at Rome in the second century, describes the Roman game as follows: "The players divide themselves into two bands. The ball is placed upon a line between them. At the two ends of the field, behind the line upon which the players are stationed, are two other lines beyond which these two bands strive to carry the ball." Varieties of the game have also been found in many other parts of the ancient world. The first travelers to the Polynesian Islands found the natives playing with a football made of fibres of bamboo. The Eskimo also played with a ball made from leather filled with moss. During the Middle Ages it flourished in Italy under the name of *calcio*. The principal home of football play, however, has been the British Isles. William Fitzstephen, in his *Vita Sancti Thomæ*, written about 1175, graphically described the assembling of the lads of London, "their parents and the rich and wealthy, in the fields of the suburbs after dinner, to enjoy the famous game of football." So popular did the sport become in the ensuing centuries that king after king issued proclamations against it in order to protect the warlike pastime of archery. Edward II in 1314 forbade football "on pain of imprisonment to be played in the future," and almost 100 years after we find Henry VI proclaiming that "na man shall play at the fut ball." Notwithstanding these and other repressive laws, football flourished prodigiously in England. At times town would challenge town, or parish would be arrayed against parish. Such games were played over vast areas, sometimes miles in extent, and were participated in by several hundred players. There also were in this period games between small bodies of men, playing according to crude but orderly rules. English literature from Chaucer to Shakespeare abounds in allusions to the sport. By 1800 football in England had evolved into several highly specialized types of games which were played respectively at Charterhouse, Eton, Harrow, Rugby, Westminster, and in the other great secondary schools. All these games were characterized by a prohibition against carrying the ball. The introduction of the carrying feature into football is attributed upon a memorial tablet at

Rugby to a schoolboy named William Webb Ellis, who in the closing minute of a drawn game in the autumn of 1823, "with a fine disregard for the rules of football as played in his time, first took the ball in his arms and ran with it, thus originating the distinctive feature of the Rugby game." In the 40 years that followed many clubs sprang up throughout England, some playing the kicking and others the carrying game, but all handicapped by a lack of uniform rules. In 1863 a conference was held by the football men at Cambridge University, and a code drafted for recreative purposes at Cambridge. Later in this same year (Dec. 1, 1863), a convention was held in London by the football clubs of the city, at which was organized the London Football Association, which adopted substantially the Cambridge rules. These rules forbade carrying the ball. Hence the type of game established by the London Football Association has since been known as the "Association" game. The names "soccer" and "socket" by which it also is known are merely humorous derivatives of the word "Association." Similarly, on Jan. 26, 1871, another convention was held in London of clubs playing the carrying style of game. This second convention resulted in the organization of the Rugby Football Union, and the adoption of the rules of Rugby School as the playing code.

This game is sometimes humorously known as "Rugger." These two great football organizations still exist and still exercise control over their respective games in England, other parts of the world accepting their jurisdiction. During the year 1913 not less than 400 professional clubs and 15,000 amateur clubs in the United Kingdom played Association football under allegiance to the Football Association. The number of professional players in the Association ranks approximated 5000 and the number of amateur players 300,000. In England alone 8000 matches of Association football were played every week for eight months in the year. The international match between England and Scotland, played at Glasgow, March 23, 1913, attracted 127,307 spectators. The growth of Association football throughout the world has been one of the most amazing features of all sport in recent years. This style of play has gained a strong foothold in all of the countries of Europe, North and South America, and in Australia and South Africa. Each country has its national organization, and La Fédération Internationale de Football Association, formed at Paris, May 21, 1904, exercises a world-wide supervision of the Association game. Rugby football in England has remained almost strictly an amateur sport and is incomparable in public interest with the Association game or with intercollegiate Rugby football in America.

The earliest mention of football in America is to be found in the *Relation of Virginia* by Henry Spellman, published about 1609. Describing the sports of the Colony, he says: "The vse beside football play which women and young men much doe play at. They make their gooles like ours only they never fighte nor pull another doone. The men play with a littel ball lettinge it fall out of their hands and striketh with the top of their foote. He that can strike the ball farthest winnes that which they play for." Random play with an inflated bladder upon village greens and country fields was a common sport of boys in America in early times. About 1840

football as a crude game made its appearance at Harvard, Princeton, and Yale. At Harvard and Yale it took the form of a rush between the two lower classes—a sport which became so rough that the faculties at each institution prohibited football in 1862. At Princeton the sport evolved into a simple but orderly game under original rules which partly resemble Association football of to-day. By 1865 this game had developed into a well-balanced system of play. During these same years a similar game was evolving at the neighboring college, Rutgers. As a result, these two institutions met in a match game (Nov. 6, 1869). This was the first intercollegiate contest in America and also antedates the first intercollegiate game in England, Cambridge *versus* Oxford (Feb. 10, 1872). During the next two years Columbia, Princeton, and Rutgers played regular schedules of games. Yale appeared as an intercollegiate competitor in 1872, and Harvard in 1874. Two years later (Nov. 26, 1876) Columbia, Harvard, Princeton, and Yale held a convention at which the American Intercollegiate Football Association was formed, and the Rugby Union rules with a few changes were adopted as the common playing code. That association lasted until 1894, during which time nearly all of the colleges of the country and most of the schools adopted the intercollegiate game.

In 1894 the Intercollegiate Association disintegrated and was followed by an association of Harvard, Pennsylvania, Princeton, and Yale as a rules committee to preserve the game. This rules committee subsequently extended its membership to include Chicago, Cornell, and the Naval Academy. In 1905 an independent association of colleges was formed which also appointed a rules committee. These two rules committees immediately coalesced and assumed control of the game, their legislation now being accepted by the schools and colleges of the country. Since the adoption of the Rugby Union rules as the intercollegiate code in 1876, this game has been in a continual state of change. Although its basic character remains Rugbian, so many original features have been introduced that it presents a distinct type of game. In 1913 the intercollegiate game was played by 400 colleges and 5000 schools. Approximately 162,000 players participated, 21,600 games were played, and 6,480,000 spectators attended. The largest attendance was that of the Army-Navy game in New York, Nov. 29, 1913, estimated at 51,000 persons.

Association Game. This game is characterized by a few simple but highly ingenious rules. It is played upon a field the maximum length of which is 130 yards, minimum 100 yards, and whose maximum width is 100 yards, minimum width 50 yards, marked with end lines (known as goal lines), side lines (known as touch lines), a halfway line, a goal area, and a penalty radius.

The ball is spherical, not less than 27 inches in circumference nor more than 28 inches. The goals are marked by posts set in the middle of the goal line, 8 yards apart, connected by a crossbar 8 feet from the ground. To score a goal the ball must pass between the posts, underneath the crossbar. The game is played by 11 men upon each side, the names of their positions and their formal stations being as follows: five forwards, known as outside left, inside left, centre, inside right, and outside right, who

deploy at equal intervals along the halfway line; a goal keeper who stands upon or near the goal line; between the halfway line and the goal line at equal distances therefrom and from one another are two lines of backs, consisting of three half backs and two full backs, arrayed upon their respective lines at equal distances from one another. The players preserve as closely as possible these relative positions to one another throughout the game, but vary in the distances according to the course of the ball. Prior to the game the two captains toss a coin. The winner of the toss has the option of a choice of goals or the kick-off. The length of a game is 90 minutes, divided into two halves of 45 minutes each, with an interval of one minute at half time, during which the opposing teams exchange goals.

The game begins with a place kick from the centre of the field. Thereafter the ball is driven by kicks, no player being permitted to handle the ball except the goal keepers, each of whom within his own penalty radius may pick up the ball and carry it, but not more than two steps. In kicking the ball long kicks are employed and a short kick known as a "dribble," by which a player while running "nurses" the ball ahead of him. If the ball is forced across the touch line, a player of the side which did not force it out throws the ball in; if it is kicked across the opponents' goal line, it is kicked off by a player of the other side from within his opponents' goal area; if a player kick the ball across his own goal line, the opponent may kick it into play from a point within one yard of the nearest corner, known as a "corner kick." A corner kick, however, may not directly score a goal. When a player is kicking the ball, any player of the same side who is nearer the opponents' goal line may not play the ball, nor interfere with an opponent, because he is what technically is termed "off-side." He does not become "on-side" until three players of the opposing side have come between him and his opponents' goal. Players are forbidden to trip each other, or to use their hands to hold or to push an opponent. They may block their opponents with their bodies, but may not charge into them from behind except when intentionally blocked by them.

Rugby Game. The Rugby game is played upon a field not exceeding 110 yards in length and not more than 75 yards in width, upon which are marked goal lines, touch lines, five-yard lines, twenty-five-yard lines, halfway line, and dead-ball lines. In the middle of each goal line two posts are placed, 11 feet high and 18 feet, 6 inches apart, connected by a crossbar 10 feet from the ground. The ball is oval in shape, its exact size and weight being regulated by rule. Fifteen players constitute a side, usually divided into eight forwards, two half backs, four three-quarter backs and one full back. Unless otherwise agreed, a game lasts 80 minutes, divided into two halves of 40 minutes. The captains prior to the game toss a coin for choice of in-goals or kick-off. Play begins with a place kick from the centre of the field, known as the kick-off. Thereafter the ball generally is put in play by a scrummage. A scrummage is formed by one or more, usually the 16 forwards, packing closely around the ball, which has been placed upon the ground and which none of the players may touch with their hands. Each pack strives to force the ball out towards its own goal, so that some one of its backs may get

it and run with it. Two methods have developed for obtaining the ball out of a scrummage, "wheeling" and "heeling." In "wheeling" the ball is secured under the foot of a player and nursed to the right or to the left, when a wheel suddenly is made upon the more favorable side by the back row bringing the ball around to the front. In "heeling" possession of the ball is obtained by "hooking" it in the front row of one of the packs and then suddenly forcing the ball out behind with the heel. When the ball comes out of scrummage, it may be kicked, picked up, and run with by any player who is not "off-side." A player is "off-side" if the ball has been touched by one of his own players who is behind him. Such an "off-side" player becomes "on-side" as soon as an opponent has touched the ball, or a player of his own side has run in front of him with the ball. Players when "off-side" may not interfere with an opponent. A player who is carrying the ball forward is stopped by opponents by what is known as a "tackle." A tackle is the seizing by one or more players of the opponent carrying the ball so that he cannot at any moment while so held pass or play it. If a player catches the ball while in flight from a kick or throw by an opponent and at the same time makes a mark with his foot at the spot of the catch, such a catch is a "fair catch" and entitles the catcher's side to a "free kick" with the ball. A match is won by the side scoring a majority of points. If a player puts his hand upon the ball while it is on the ground in his opponents' in-goal, a "try" is scored which counts three points and entitles the side scoring them to a free kick at the goal. The ball is brought out upon the field of play and placed by a player for the kicker to kick. If he kicks the ball between the posts and over the bar, a "goal from a try" is scored and counts five points, in which case the three points from the try are not counted. If a player during play drops the ball from his hands and kicks it, upon the rebound, between the posts and over the bar, a "dropped goal" is scored, which counts four points. If a goal is kicked by a place kick or a drop kick from a free kick following a fair catch, a "goal from a mark" is scored and counts three points. If such a free kick follows the imposition of a penalty, a "goal from a penalty kick" is scored and counts three points.

American Intercollegiate Game. This game is by far the most intricate and elaborate of the various games. It is played upon a rectangular field, 360 feet long, 160 feet wide, divided into a field of play, 300 feet long and 160 feet wide, and into two end zones, each 30 feet long and 160 feet wide. The field of play is divided into five-yard intervals, marked with white lines, which gives it the familiar name of "gridiron." Goal posts, 20 feet high, 18 feet 6 inches apart, connected by a crossbar 10 feet from the ground, are set in the middle of each goal line. The ball is oval in shape. The teams consist of 11 players upon a side, divided into forwards and backs. The forwards, seven in number, comprise the rush line and are left and right end, left and right tackle, left and right guard, and centre. The back field contains a quarter back, two half backs, and a full back. The length of a game is 60 minutes, divided into four quarters of 15 minutes each. Between the first and second quarters and between the third and fourth quarters occurs an interval of one

minute, during which the teams exchange goals. Between the second and third quarters occurs an intermission of 15 minutes, during which the two teams leave the field to rest.

The two captains having decided the choice of goals and kick-off by tossing a coin, play begins with a kick-off from the kicker's 40-yard line. There are three methods of advancing the ball—rushing, forward passing, and kicking. Rushing is carrying the ball forward in the arms. Ordinarily the ball is put in play by a scrimmage. The two rush lines face each other in two lines. One side receives possession of the ball. A player places the ball upon the ground and "snaps" it into play by sweeping it backward between his legs into the hands of a back, who may carry it forward or pass it to an associate to carry it forward. A team upon obtaining possession of the ball is allowed four attempts called "downs" to advance the ball a distance of 10 yards. If this distance is gained, the ensuing down becomes a first down; if a team fails to gain the distance, the ball must be surrendered to the other side. On account of this orderly possession of the ball each team attempts to advance it by an elaborate system of tactical formations and manœuvres, known as "plays," which have been planned and practiced in advance and which are controlled by a secret numerical system of signals.

Passing the ball forward consists of throwing the ball forward to a comrade. This form of attack is hedged with technicalities. The ball must be passed from a point at least five yards behind the line of scrimmage; it may be caught only by the players upon the ends of the line, or by backs who were one yard behind the line when the ball was put in play, and the ball may not touch the ground before being caught. When a team perceives that it will not make the necessary 10 yards in its four downs, the practice is not to attempt to rush the ball on the last down, but to kick it so as to place it as far away from their goal as possible. Fair catches and free kicks, off-side and on-side play, with slight variation in technical details, exist in the Intercollegiate game as in the Rugby game. The game is awarded to the team scoring the most points. If a player lawfully carries or obtains the ball across his opponents' goal line, a touchdown is scored which counts six points and entitles the team scoring the same to a try at goal by a place kick, which, if successful, counts an additional point. A goal from the field by a drop kick or by a place kick counts three points. Either may be kicked during regular play or may be kicked from a free kick following a fair catch. If a player of the side in possession of the ball is forced to touch the ball to the ground behind his own goal, provided a player of his side caused the ball to cross his goal line, a safety is scored which counts two points for the opponents.

Gaelic Football is a very old Irish game which has been revived in recent years. It is played by teams of from 14 to 21 players, although the common number is 15. Besides the usual goal posts there are outer-point posts which give added opportunities for scoring. The teams line up for play in two parallel lines, the opponents holding hands. The ball then is thrown into the centre of the line, and the game begins. Having caught the ball, a player may advance it by kicking or striking with the hand, but he may not throw or carry it. A resulting

method of play is that of "hopping," by which the ball is kept bounding between the hand and the ground, while the player rapidly advances down the field.

FOOTE, ALLEN RIPLEY (1842-). An American economist, born at Oleott, Niagara Co., N. Y. He was educated in the public schools and served in the Civil War, was editor of *Public Policy* from 1899 to 1905, became president of the National Tax Association upon its organization in 1907, and president of the Ohio State Board of Commerce in 1909, after eight years' service as commissioner. He identified himself actively with various leading economic and social science organizations and published: *Economic Value of Electric Light and Power* (1899); *Municipal Public Service Industries* (1899); *Constitutional Municipal Government* (1900); *Public Policy Editorials* (3 vols., 1901-03); *Employers and Employees* (1902); *Labor, Capital, and the Public* (1905); *Regulation of Public Utilities* (1911); *Compensation for Industrial Injuries* (1913).

FOOTE, ANDREW HULL (1806-63). A distinguished officer of the United States navy. He was born in New Haven, Conn., on Sept. 12, 1806, the son of Samuel A. Foote (q.v.); studied at West Point for several months, and became acting midshipman in the navy on Dec. 4, 1822. He was commissioned lieutenant on May 27, 1830; from 1837 to 1840 was executive officer of the *John Adams*, of the East India squadron, during its cruise around the world, and from 1841 to 1843 was stationed at the Naval Asylum in Philadelphia, of which during the last two years he was in full charge. He was executive officer of the Boston Navy Yard from June, 1846, to June, 1848, and from 1849 to 1851, as commander of the brig *Perry*—his first independent command—cruised along the African coast for the purpose of protecting American commerce and suppressing the slave trade. In December, 1852, he was promoted to the rank of commander. After four years of shore duty he was appointed to the *Portsmouth*, April 5, 1856, and was ordered to join Commodore Armstrong's fleet on the East India Station. On arriving at Canton he established fortified posts on shore for the protection of American residents; but Commodore Armstrong soon afterward ordered that the American marines be withdrawn, and while Foote was making arrangements to this end he was fired on from the so-called Barrier Forts (q.v.), which he stormed and captured a week later, acting under Armstrong's orders. Soon after his return—in October, 1858—he was appointed commandant of the Brooklyn Navy Yard, which position he relinquished, with the rank of captain, in August, 1861, soon after the beginning of the Civil War, to accept the command of the naval operations in southwestern waters. On Sept. 6, 1861,

he assumed command at St. Louis and for some time devoted himself with great energy to the task of preparing his flotilla for action. On Feb. 6, 1862, he captured Fort Henry, and on the 14th he attacked Fort Donelson, before which Grant with his army had arrived two days earlier; but the attack was repulsed and Foote was wounded. (See FORT HENRY AND FORT DONELSON.) Island No. 10 (q.v.), after a siege by Foote and the forces under Pope, surrendered on April 7. On May 9, his wound having become serious, Foote left the command of the fleet in the hands of Capt. Charles H. Davis, and on July 17, 1862, at his own request, was formally detached from the Western flotilla. He had become a flag officer in November, 1861, and on July 16 was promoted to be a rear admiral. For several months in 1862-63 he was chief of the Bureau of Equipment and Recruiting, and on June 4, 1863, was appointed to succeed Rear Admiral Dupont as commander of the fleet off Charleston, but died at New York, on June 26, while on his way to assume the duties of his new position. Foote published a book entitled *Africa and the American Flag* (1854), based largely on his African cruise of 1849-51. Consult Hoppin, *Life of Rear-Admiral Andrew Hull Foote* (New York, 1874).

FOOTE, ARTHUR (1853-). An American composer, born at Salem, Mass. He studied piano and harmony with Stephen A. Emery and subsequently at Harvard University (class of 1874) with John K. Paine, continuing for a year after graduation. On leaving college he studied piano and organ playing with B. J. Lang and shortly afterward settled in Boston. From 1878 to 1910 he was organist of the First Unitarian Church of Boston. His compositions include works for orchestra (*Serenade* in E major for strings; overture, *In the Mountains*; prologue, *Francesca da Rimini*; two suites, in D minor and E); chamber music; chorus and orchestra (*Wreck of the Hesperus*; *Skeleton in Armor*; *Farewell to Hiawatha*); much church music, organ and piano pieces; and about 60 songs. Foote's work has been rather more along classical lines than in the romantic school, but a tendency towards the latter showed itself in his later compositions.

FOOTE, HENRY STUART (1800-80). An American politician, born in Fauquier Co., Va. He graduated at Washington College (now Washington and Lee University), Lexington, Va., in 1819, and, after being admitted to the bar in 1822, removed in 1824 to Tusculum, Ala., where he practiced law and edited a Democratic newspaper. Two years later he removed to Natchez, and soon afterward to Vicksburg, Miss., where he established the weekly *Mississippian*, favored the election of judges, and became a leader of the Democratic party, allying himself at first with the extreme States Rights branch and being elected to the Lower House of the State Legislature in 1839. In 1847 after a sharp contest he was elected to the United States Senate. He favored the annexation of Cuba, Yucatan, and Mexico, declaring that only thus could the continued possession of California and Oregon by the United States be assured. He was the author of the proposal for a grand committee of 13, which, after Webster had spoken in its favor, was accepted. It was this committee with Clay as its chairman that drew up the famous compromise measures. Later he introduced the "finality resolutions,"

by which the compromise laws were declared to be a "final settlement of all controversies growing out of slavery." After supporting the Compromise of 1850, which was opposed by all the other Mississippi representatives, he publicly defended himself at home and formed a Unionist party in the State. In 1852 he resigned his seat in the Senate to enter the contest for Governor of Mississippi as the Unionist candidate against John A. Quitman, Secessionist. Quitman, soon realizing that there was no chance of his own election, withdrew in favor of Jefferson Davis, who resigned from the Senate as Foote had done, but was defeated. On the conclusion of his term as Governor, Foote removed to California, but returned to Mississippi in 1858, practiced law in Vicksburg, and again entered the fight against the secession movement, participating in the Southern Convention at Knoxville, Tenn., in 1859, as one of the strongest opponents of disunion. He settled in Nashville, Tenn., when secession sentiment became too strong in Mississippi. But he cast in his lot with the Confederacy upon the secession of Tennessee and was chosen a member of the first and second Confederate congresses. His attacks on Jefferson Davis, his old rival, were bitter. Foote was in Washington even before Lee's surrender and after the restoration of peace practiced law there. His counsel was sought by the Northern leaders in regard to reconstruction matters. He became a strong supporter of Grant, whose Southern policy he favored, and by whom he was made director of the United States Mint at New Orleans, which position he held until shortly before his death. He published: *Texas and the Texans* (1841); *History of the Southern Struggle* (1846); *History of the Civil War; or, Scylla and Charybdis* (1867); *Casket of Reminiscences* (1874); *Bench and Bar of the South and Southwest* (1876).

FOOTE, MARY HALLOCK (1847-). An American artist and novelist, born in Milton, N. Y. She studied art in New York and in 1876 married Arthur D. Foote, a mining engineer. Thereafter she lived in California, Colorado, and Idaho, which have given themes for her novels and drawings. She also furnished elaborate illustrations for Longfellow's "Skeleton in Armor" and "The Hanging of the Crane." Representative of her fiction are: *The Led Horse Claim* (1883); *John Bowdoin's Testimony* (1886); *The Last Assembly Ball* (1889); *The Chosen Valley* (1892); *Cœur d'Alene* (1894); *In Exile* (1894); *The Cup of Trembling* (1895); *The Royal Americans* (1910); *Picked Company* (1912).

FOOTE, SAMUEL (1720-1777). An English actor and playwright, born at Truro in Cornwall. In 1737 he entered Worcester College, Oxford, but left without a degree and proceeded to the Temple. His fortune soon dissipated at the London coffeehouses, he turned to the stage for a means of support (1744). In 1747, with a piece entitled *Diversions of the Morning*, he opened the Haymarket Theatre, where he was at once director, actor, and dramatic author. In this and other pieces he introduced well-known living characters and by his admirable powers of mimicry succeeded in drawing large audiences, till the theatre was closed by order of the magistrates. He, however, managed to continue his dramatic performances by calling them "teas." These teas closed in 1753, and Foote returned to the regular stage, writing and adapting many plays and acting in many parts, in London,

Dublin, and Edinburgh. In 1766 he broke his leg by a fall from his horse, and amputation was found necessary. Full of resources, he turned the incident to account on the stage, composing plays, e.g., *The Lane Lover* and *The Devil on Two Sticks*, expressly adapted to his own state. He died Oct. 21, 1777. Among his plays are *The Minor*, *The Liar*, and *The Mayor of Garratt*. Foote had a great reputation as a wit. His *Works*, including a memoir of him, were edited by John Bee (Badcock) (London, 1830). Consult: Cook, *Memoirs of Samuel Foote, with a Collection of his Bons Mots* (London, 1805); Davies, *Life of Garrick* (ib., 1780); Forster, *Historical and Biographical Essays* (2 vols., ib., 1860); Dibdin, *Annals of the Edinburgh Stage* (ib., 1888); Fitzgerald, *Samuel Foote* (ib., 1910).

FOOTE, SAMUEL AUGUSTUS (1780-1846). An American politician, born in Cheshire, Conn. He graduated at Yale in 1797 and was a merchant. After serving for some time in the State Legislature and twice being Speaker of the House, he was a Whig member of Congress in 1819-21 and 1823-25, of the Senate in 1827-33, and again of Congress in 1833-34. He was Governor of Connecticut in 1834-36. He was the author of "Foote's resolution," Dec. 29, 1829 (to restrict the sale of public lands), which provoked the debate (January, 1830) between Senators Hayne of South Carolina and Webster of Massachusetts.

FOOT GUARDS. Select regiments of infantry, organizations common to European armies. In the British army it includes the First, Second, and Third battalions of Grenadier Guards (q.v.), the First, Second, and Third battalions of Coldstream Guards (q.v.), the First, Second, and Third battalions of Scots Guards, and the Irish Guards, the First Battalion of which was formed in 1902. Like the German guard corps, they are not locally distributed throughout the Empire, but have permanent stations. See **HOUSEHOLD TROOPS**.

FOOTMAN MOTH. A name among British lepidopterists for the small yellowish-gray moths of the family Lithosiidæ, allied to the tiger moths.

FOOT POUND. The unit of work (q.v.) in the foot-poundal system, and corresponding to the amount of work required to raise one pound one foot vertically against the force of gravity at sea level in lat. 45°. See **MECHANICAL UNITS**.

FOOTPRINT, FOSSIL. See **FOSSIL**; **ICHOLOGY**.

FOOT ROT. A hoof disease of sheep. Two varieties are recognized, the commoner consisting of an excessive growth of hoof, which at the toe or round the margin becomes turned down, cracked, or torn, and thus affords lodgment for sand and dirt. Irregular wearing of the hoof is the cause, and hence the prevalence of foot rot in soft rich pastures, and especially among sheep previously accustomed to bare, rough, or upland walks, where the hoof is naturally worn down by the greater amount of walking necessary to procure sustenance. Taken in time, when lameness is first apparent, and before the hoof is cracked and the foot inflamed, a cure rapidly follows the careful paring of the superfluous and diseased hoof; indeed, further treatment is scarcely necessary, unless the vascular parts have been laid bare, when a little tar may be applied as a mild astringent and protection from flies. When, from inattention or neglect, the hoof is separated

from the sensitive parts beneath, when ulcers appear on the sole, or proud flesh develops, active astringents or mild caustics are necessary. Butter of antimony, diluted with an equal quantity of tincture of myrrh, is a good remedy when cautiously and temperately used. A convenient paste, which in inexperienced hands is safer than a fluid caustic, may be made with equal weights of flowers of sulphur and finely powdered sulphate of copper, rubbed up to the needed consistency with lard or oil. For the form of foot rot due to the necrosis bacillus a foot bath of a solution of copper sulphate is recommended. The second and more troublesome variety, instead of commencing at the ground surface, begins in the interdigital space or at the coronet and is contagious. The foot is hot, tender, and swollen around and immediately above the coronet. There are ulcerations in the interdigital space, and the swelling, and subsequently the appearance of proud flesh, cause a separation of the toes. When the tenderness and heat are great, poultices are advisable; but in the milder cases and earlier stages the parts should be well washed with a solution containing to the pint of water half an ounce each of sulphuric acid and oil of turpentine. When ulcers appear, they must be touched with lunar caustic, or dressed with the paste already recommended. Consult Melvin and Mohler, "Lip-and-Leg Ulceration of Sheep," *United States Department of Agriculture, Bureau of Animal Industry, Circular 160* (1910).

FOOTSCRAY, fööts'krä. A city of Bourke Co., Victoria, Australia, on the Salt Water River, a suburb of Melbourne, 4 miles west of the city limits (Map: Victoria, D 5). It manufactures sugar, jute, soap, woolen goods, chemicals, and machinery, and its bluestone quarries furnish much of the material for the new buildings of Melbourne. It is one of the constituent towns of Greater Melbourne. Pop., 1901, 18,318; 1911, 23,643.

FOOTWALL. A term used in mining, to indicate the lower wall of an inclined ore body or coal seam. It underlies the ore body immediately and often serves as a slanting floor on which tracks can be laid for hauling up the ore. The upper wall or roof is known as the hanging wall. See **MINING**.

FOOT WASHING. A custom of the early Church, having its origin in necessities produced by Eastern climate and modes of dress and in the obligations attached to the rites of hospitality. In the most primitive times the feet were without covering, and sandals afforded protection only to the sole. Consequently, after any journey in the heat and sand, bathing the feet, if not absolutely required, was at least convenient and refreshing. Servants of a household were accustomed to perform this work for the guests, and thus it became a significant sign of humility. In memory and imitation of the example of Christ at the Last Supper (John xiii), the earliest Christians were accustomed to regard it as a praiseworthy act of piety. By the end of the fourth century it was specially connected with the observances of the Thursday before Easter, when, at least in the churches of Africa, Gaul, and Milan, it was the custom for the Bishop to wash the feet of the newly baptized with solemn ritual observances. When infant baptism became the rule, foot washing was dissociated from the administration of the sacrament; but as a liturgical

custom observed on Maundy Thursday, it became more and more generally practiced. Augustine mentions it (*Epistle ad Januarium*). Earlier editions of the *Ordo Romanus* do not mention it, but the later ones speak of the Pope performing the ceremony for 12 subdeacons. As in monasteries where was a twofold observance, by the brethren among themselves and by the abbot and others for numerous poor people, so the Pope and other bishops added the washing of the feet of representative poor men, who also received food and gifts. It was also frequently, and is still in some courts (e.g., Vienna and Madrid), practiced by monarchs. At Rome, while the Gospel narrative is sung (from whose first words in Latin, *Mandatum novum*, 'a new commandment,' John xiii. 34, the name of Maundy or Mandate Thursday is derived), the representatives of the Apostles take their seats, dressed in white woolen tunics, and the Pope, in similar attire, sprinkles a few drops of water on the right foot of each, then wipes and kisses it. After this a repast is given, at which the Pope and his cabinet wait on the old men, who at the close take with them the tunics and towels, with the addition of a small gratuity in money. The Anabaptists, at the Reformation, continued the practice. The Moravians revived it, but without strictly enforcing it. In modern times it has been regularly practiced among the Dunkers (see CHURCH OF THE BRETHREN), Winebrennerians, and the Glassites or Sandemanians. It is a part of the ceremonies of Easter week at Jerusalem, in the Russian church.

FOPPA, fóp/pá, VINCENZO (called Il Vecchio) (c.1427-1515). A Lombard painter of the Renaissance. He was born at Brescia and was probably a pupil of Squarcione at Padua and was later influenced by Bramante. According to his latest biographies, however, he received his early training at Verona. Little is known of his early life. About 1456 he removed to Pavia and was employed by the Sforzas in that city and in Milan, where he executed many important works. These were generally in fresco, and many have been destroyed. Among those surviving are the "Church Fathers" in the Portinari Chapel in San Eustorgio, the remaining frescoes in which are after his designs; "St. Sebastian," in the Brera, Milan; "St. Francis Receiving the Stigmata" and "St. Sebastian" and other frescoes, in the Castello Museum. His best panels are: "St. Jerome Praying" and a "Crucifixion," both at Bergamo; a fine altarpiece in Santa Maria di Castello, Savona; "The Adoration of the Kings," in the National Gallery, London; and a "Deposition," in Berlin. His Madonnas resemble Bellini's, one of the best being in possession of Prince Trivulzio, Milan. Others are owned by Theodore Davis, Newport, R. I., and J. G. Johnson, Philadelphia. The last years of his life were spent at Brescia, whither he returned in 1489. Foppa is the founder of the Lombard school, and his influence was felt over the whole of northern Italy. His traditions, carried on by Borgognone, survived until Leonardo da Vinci's advent. Grandeur of form, impressive composition, shimmering silvery-gray color, and severe yet tender conception are the characteristics of his art. Consult his biography by Ffoulkes and Maiocchi (London, 1909), and Berenson. *North Italian Painters of the Renaissance* (New York, 1907).

FORAGE, IN AGRICULTURE. See FEEDING STUFFS.

FOR/AGE (OF. *fourage*, Fr. *fourrage*, from OF. *forrer*, to forage, from *forre*, *fuerre*, Fr. *feurre*, from ML. *fo drum*, forage, from *voder*, AS. *fôdor*, Eng. *fodder*, OHG. *fuotar*, Ger. *Futter*, food; connected also with AS. *fôda*, Eng. *food*, and with Gk. *παρεῖσθαι*, *pateisthai*, to feed). In military usage, the food issued by the government for animals. In the United States army the forage ration for a horse, as provided in the Army Regulations, 1913, is 14 pounds of hay and 12 pounds of oats, corn, or barley; for a mule, 14 pounds of hay and 9 pounds of oats, corn, or barley. To each animal 3 pounds of bran may be issued in lieu of that quantity of grain. One hundred pounds of straw per month is allowed for each horse or mule. On the march grain is usually the only forage carried. Department commanders will reduce the ration when necessary. Where grazing is practicable, or when little labor is required, commanding officers are authorized to order a judicious reduction of the allowance. Forage is furnished only to mounted officers for the authorized number of horses owned and actually kept by them in the performance of their official duties when serving with troops in the field or at military posts and stations. When oats and hay, the usual ration, is not available, green forage, beans, peas, rice, *palay* (unshelled rice in the Philippines), wheat, or rye may be used. Wheat and rye should be crushed and fed sparingly (about one-fourth of the allowance). For unshelled corn add about one quarter by weight. In the cavalry a small reserve of grain—about six pounds—is carried on the horse. In the artillery a small reserve is carried on the carriages. Consult *Field Service Regulations*, United States Army (Washington, 1914).

FOR/AGING ANT. An ant of the Central American genus *Eciton*, usually called army ants in Nicaragua, because they go about in large bodies, making forays upon insects and other small animals. These columns may be three or four yards wide and include many thousands of individuals. As they march forward, smaller columns are pushed out ahead or on the flanks, which find and flush the prey. Larger animals flee; insects try to leap away, but more often jump into the midst of the ants, and even the largest are soon overpowered and torn to pieces. The ants explore thickets and brush heaps, driving everything to the twigs and then catching and pulling them down; but spiders often escape by letting themselves hang by a silken thread. Ant birds, ant thrushes, and their allies accompany such a foray through the forest, darting at the escaping insects, and feeding on the ants themselves. Several species of *Eciton* inhabit the American tropics, one of which devotes its excursions to harrying the nests of a certain small and timid ant (*Hypoclinea*), which it ousts from its galleries and robs of pupæ and larvæ, but does not otherwise injure. "The moving columns of *Ecitons* are composed almost wholly of workers of different sizes, but at intervals of two or three yards there are larger and lighter-colored individuals that will often stop, and sometimes run a little backward, halting and touching some of the ants with their antennæ. They look like officers giving orders and directing the march of the column."

These ants are of various species and differ in size, food, and methods of foraging. The

Ecitons are remarkable in having no permanent home. On the contrary, they make a temporary habitation in some hollow under a log or in the ground, where great masses cluster together like a hanging swarm of bees, in the centre of which the larvæ and pupæ are kept warm. These, with their nurses, seem to occupy a chamber within a living nest, and tunnel-like entrances are kept open along which food is carried by those left at work outside. Few ants show a greater sense of organization and mutual helpfulness than do these, and they seem to stand at the head of the tribe in point of intelligence. A circumstantial account of several species is given by Belt, in his *Naturalist in Nicaragua* (New York, 1911), from which the sketch here given has been condensed.

FORAIN, fô'rân', JEAN LOUIS (1852-). A noted French caricaturist, lithographer, etcher, and painter. He was born at Rheims and studied a short time under Gérôme at the Ecole des Beaux-Arts, but was largely self-taught, receiving his chief inspiration from Manet and Degas. One of the greatest draftsmen of his time, Forain is an unsurpassed master of elimination and suggestion and conveys a remarkable power of expression. His satire, though restricted in innuendo, penetrates to the very heart of the social, political, and judicial life of Paris, which he caricatures with refined but caustic wit. His first drawing appeared in *La Cravache* in 1876, and he later contributed to the *Figaro*, *Le Rire*, *Le Courrier Français*, and other periodicals. At the time of the Dreyfus agitation in 1898 he founded, with Caran d'Ache, the anti-Semitic periodical, *Psst*. His drawings, which have been published in album form, include *La comédie parisienne* (1892); *Les temps difficiles* (1893); *Deux pays* (1897). The Dresden Print Room contains the finest collection of his original lithographs and etchings. Among the best of the former are "The Strike," "Le Cabinet Particulier," "At the Folies-Bergère," "Papa's Pictures." His most noted etchings include "The Prodigal Son," "Mlle. Mere," and "The Prisoner

and his Child." Forain's paintings are less important. Consult: Lehrs, "Forain," in *Die graphischen Künste* (Vienna, 1911); Guérin, *Forain, Lithographe* (Paris, 1910); Singer, "Lithographs and Etchings by Forain," in the *International Studio* (New York, 1909).

FORAKER, JOSEPH BENSON (1846-). An American Republican politician and legislator, born near Rainsboro, Highland Co., Ohio. Enlisting in 1862 as a private in the Eighty-ninth Ohio Volunteer Infantry, he was for a time aid to Maj. Gen. H. W. Slocum and in 1865 was brevetted captain. Immediately after the war he entered Ohio Wesleyan University, and two years later the junior class at Cornell University, where he graduated in 1869. He studied law and was admitted to the bar at Cincinnati, where he practiced with success until 1879, when he was elected a judge of the Superior Court. He resigned from the bench in 1882 and in 1885 was elected Governor of Ohio on the Republican ticket. He was reelected in 1887, but was defeated for a third term in 1889, by James E. Campbell, although all the rest of the Republican State ticket was elected. From 1889 to 1897 he practiced law in Cincinnati. In 1897-1909 he was United States Senator. He was one of the most radical advocates of the war with Spain in 1898. He was a strong supporter of McKinley, but was opposed to many of Roosevelt's measures, in 1905 was one of the few members of Congress who openly opposed the regulation of railway rates by the Government, and in 1906-07 attacked Roosevelt for his action in the Brownsville case (see BROWNSVILLE, TEXAS) and attempted to turn the negro vote away from the President. The bill for the government of Porto Rico, in effect May, 1900, is called the Foraker Act. In May, 1914, Foraker announced that he would run again for the United States Senate, to clear himself of charges made by his political opponents in Ohio, based on testimony of Colonel Mulhall in 1913 before the Senate lobby investigating committee.
